>

Larger pulley's on the output shaft of the alternator, testing them when
they are cold, not running them all the time.

> Spinning them faster 'should' only generate more heat, not amps:-)!

Not necessarily true.

People are running 3CX3K amps on a single alternator, using a 14 inch or
bigger mainshaft pulley, and getting full power out of them because the
alternator will push more current the faster the rotor is spinning in the
stator.

Law of physics their.

>
> I am not criticising, just questioning.

Not a problem.

>
> I received the full catalogue from C.E. Niehoff Brushless Alternators.

And what do you think?

>
> Did you ever find out more info on the large Mitsubishi 500 ampre?

No. Last time I called the place he wasn't too friendly about it, either.

Makes me think he was fulla shit about it in the first place.

What have you seen in the Neihoff catalog.

>
> My last e-mail from Mitsubishi told me that they would look into the

> of the above or Electrodyne.

Your right. They are the biggest, baddest alternator out their Vs. Price.

Because they are the biggest company in the game.

>
> As well as continuing down the higher efficiency FET route (no doubt not
> allowed in shoot-outs) I will spend some time looking into the pro's and
> con's of switching supplies for the HT in an AC mobile situ.

Sky class will let you run anything.

And for that matter, you should be able to run whatever transistor you want
in the classes, in whatever mode you want.

Because that transistor is rated at 12 volts input makes it legal.. At
least, it is legal when I use 8XMRF455s in the same class with 8X2879s!

But, then again, we went through this last year, too.

>
> You mention hash from a switcher supply, which I'm sure can be sorted.

> totally quiet.

Nope.

The last switcher I used was about 10 years ago. I have 3X5 volt at 75 amp.
I put them at 4.75 a piece (or thereabouts) and used them to power 4 pills
on the base.

Had to turn them off when I was not keyed, as it took out the RX.

As well as the fact that for a switcher to stay together, it has to have
nearly 20 percent load on the output at all times.

Kinda takes away the efficiency unloaded.

I would be interested in seeing the new ones, though. I hear they are
clean.

Once again, showing that you don't know a fucking thing, aren't you...

The Zener action of a Zener diode won't happen until you hit the prescribed voltage.

All diodes are zeners. The standard silicon diode avalanches at .6 to .7 volts.

A larger zener diode avalanches at a higher, prescribed voltage.

Have a nice day, and next time, do a little reading before you spew.

Dumby, eh?

I believe that you meant... Dummy..., DUMMY!

Anyway, I can see from you lack of mastery of even basic phonetic skills (Hooked on Phonics would have been a better XMas present for yourself than that 32 pill) that you don't have a degree... Hell, to get a degree you also have to pass the basic RRR classes.

So, have a nice day. It is plainly obvious that you don't know what you are talking about, don't have a clue as to RF amplifiers in either theory or working knowledge, and can't shut your hole long enough to learn something from the boyz on this newsgroup who have "been their, done that".

Have a nice day, Pozersack, but please, I beggith of you, don't attempt to tell people what you know.

This newsgroup doesn't listen to anyone tell us how smart they are... We stand by and wait for you to slip up and make a fool out of yourself (like you have, and I pointed out in this thread... Hell, at one point, you AGREED to what I am stating), and then shows no mercy.

Sad, but true. You buried yourself with your lies and fairy tales of grandness.

I don't care what your regulators go to, what the standard voltage output is on those alternators is governed by more than those DaveMade regulators you have!

Hell, a 165 amp Leece alternator will do nearly 65 volts full field, with close to no load, but nowhere near that when you put a load on it.

Once again, you have shown you are a newbie, an idiot, and incapable of learning anything.

Almost all alternators will go to 24 volts, they just don't do rated current at that level.

Once you go above 14.4 volts, all bets are off as to what that stator will put out when subjected to a load.

Well once again you are showing that you don't know a fucking thing.
The Zener action happens when you reverse bias the diode. A standard
diode avalanches at the reverse break over voltage, and its not .7
stupid. a 1N4004 has a reverse break over of 400 volts, but the
forward bias is still .6 to .7. Do you know the difference between
forward and reverse bias? Here's a hint dumb ass, a 16 volt zener
will break over in reverse bias at 16 volts, but guess what when you
forward bias its .6 to .7 volts. Do you have another idea what the
forward break over on a zener diode is? Put a diode across your output
and see what happens. Read up on diodes next time, you don't have a
damn clue. Elementary electronics and you flunked.
Have a nice day, and next time, do a little reading before you spew.

No you reread it dildo, Tool free is trying to tell everyone to put a zener diode across their output. Do you know what voltage it takes to turn on a zener when its forward biased? I thought not, its .7 volts. How would you say that would effect your output when you clip half of your output waveform to .7 volts? You evidently don't understand simple electronics theory do you? Get a book and READ, then maybe you will understand.

....I think the chances of retuning the typical output stages of a solid state rig to match a 3:1 swr is almost nil. I won't say it can't be done but I doubt there is sufficient range in the tuning mechanisms to conjugate match a high +/-j factor. You would most likely need to modify the output stage with different component values which still doesn't increase the output from your antenna to any great degree.

> Nope. Bob is right. The power "lost" fable is one of the oldest
out
> there.
>---------------------------------------

....It is not a fable. The power is lost (in coax) as heat.
....Here's what happens to cause it.
....Think of your signal as a series of pulses or charges leaving
the transmitter. These pulses reach the antenna and are absorbed by
the antenna's resistance which in turn creates circulating currents
on an antenna element thus radiating that signal into the air. This
assumes the antenna is well tuned and matched to the coax impedance
leaving only a resistance and no reactances. i.e.. no reflected
power.
....Now present that series of pulses to an antenna that is reactive
in either direction and see what happens.
....As the forward power advances towards the antenna it will meet
up with that reflected power coming back down the line. The
magnitude and phase of that ref power will depend on whether the
antenna presents a high inductive or capacitive reactance.
....When these signal components meet there's gonna' be a tangle.
You'll have voltages and currents of opposite polarity trying to
occupy the same space on the line. In it's simplest form, like
connecting both ends of a battery together. You get a current flow
as the two voltages try to defeat each other. If the voltages are
high enough you can have a fairly large current flow. If the current
is high and the wire size is too small to carry that amount of
current you will have heat generated. Not unlike the action in
everyday household wiring. Too much current on a small a wire causes
heat.
....Since these pulses or charges are repetitive and change polarity
every few feet (hence 1/4 wave, 1/2 wave etc.) you will find that

the coax begins to heat at regular intervals along the length of the line. These points are the physical indication of a series of standing waves.
....Trust me when I say this is a simplification and I hope it brings to light the idea I was attempting to illuminate.
Thanks for the reading, BobC

A little clarification does seem to be in order since Ed's net chart for those interested in DXing doesn't exactly seem to indicate that legal CB operation is necessarily the focus of this group.

While it is admirable to petition the FCC to make changes to their outdated CB rules, perhaps it would be wise to downplay activities which don't comply with the current rules.

It may not be possible or desirable to organize CB operators, but any effort to bring the rules more in line with real world operation might be worth pursuing.

Greetings!

[For those reading this thread - some are renowned for their knowledge, this is a re-hash, my appologies - but for those interested but not quite getting an idea, this is for them.]

You're forgetting some key points. Coax becomes an active part of the antenna system when SWR measured at the feedpoint, is far different from the measurement done at the radio [point of origin]. The coax in this case, cannot be assumed to give "true" SWR, only "apparent" for injection of the SWR meter and it's patch cord affects the response of the whole system.

The above is the best definition I can give.

Simply, when the coax quits being a simple feedline, and becomes part of the antenna [radiating coax], true versus apparent SWR readings become clear.

Apparent versus true. If foward and reflected waves are out of phase, the standing waves generated on the line, at various points along the coax, are summed together. This summation has negative values. This can have, and has, a measureable effect on trying to obtain true SWR readings. For forward power waves, travelling along the line, can meet and react with reflected waves from the unused power, and altered phase angle [+/-jX] due to interaction of the forward waves with the radiator being returned and the resulting interaction.

There have been cases where forward power is 180 degrees out of phase with the reflected, and return energy meeting at the meter, are effectively cancelled out. Just a few inches away along this same line, a dangerously high reflected voltage appears that can do some serious damage to finals.

True SWR, should be the entire systems SWR. Correct? [Thinking that Characteristic Impedance = True SWR for whole system.]

I should also step-back a moment and help to define this Characteristic Impedance meaning as I see it.

This is simply the overall impedance of the antenna system - measured at the radio, or origin of the feeline. This overall value, is based upon the whole antenna system, including feedline, mount, and antenna.

Then this value is compared to an expected impedance of the device producing RF. In this case, CB radios have 50 ohms. This gives you at least a value for comparison.

To derive SWR, if the impedance of the antenna system equals the impedance at the test SWR jig, then we can safely assume that SWR should be 1:1.

If the impedance is not equal, we have a R+/-jX problem. Could be interpeted as the fault of the antenna, or the coax - or both.

Standing waves exist on any antennas' feedline. If reflected and forward waves are not out of phase [phase relationship] we can also see a low SWR.

Apparent SWR is by measurement at points along the coax, demonstrating that SWR at that given point changes - and is not consistent with overall Characertistic Impedance, proven by re-locating the SWR test jig at another random point.

You can use an antenna on a poor ground plane. With a given length of coax, this presents arbitrarily, a 2:1 mis-match.

Add a patch cord, now the antenna system shows 1.5:1 mis-match.

Ok, whats happening?

Are we fooling the meter? How?

Apparent, at that point of measurement.

True is only characteristic of the whole system, measured at the feedpoint - and is *or should be* the same measured at the radios feedline end.

Why do some applications fail to agree?

You need to re-evaluate the system.

Coax, inherently, is unbalanced. It provides a given level of inductance and capacitance for it's length.

When using coax on an unbalanced system, e.g. - Magnetic Mounts. We only are seeing the antenna as the radiator, working against two variables that occur - the coax, because of it's unbalanced electrical connection made at the antennas' mount, and the reflecting/reactive element of the ground plane.

The antenna is this case is really a mono-pole type.

It's not truly a dipole for the other element is not electrically connected to the antenna. It's generating an image by impinging an opposite effect on the other working element. It's characteristic impedance may be different than that of the coax. It's inductively and capacitively working a field that is generating an opposite effect onto another element that simply is not bonded to the coax at the feedpoint.

People should understand that the use of Coax on an antenna system can have two basic effects. A feedline, and, an active portion of the

antenna. Between these two effects, you have "True" verus "Apparent".

I hope this stays on topic with your standards.

While Dancing with the Mouse on Wed, 10 Nov 1999 05:40:40 GMT, the
Modem interrupted with an MNI from "warnergt@ptd.net (George Warner)",
and the MotherBoard buffered this to Video RAM:

Do the same measurements I talked about the other day on the stock microphone and make notes. Actually, I would first see if the radio receives with the microphone unplugged. If it doesn't, you know that it uses the Rx lead to Gnd in the microphone. Compare these to the measurements taken on the Mura mic. I think you'll find that each microphone has equivalent connections.

Colt Black Shadow 1000. Not a bad radio. "Upgraded" to TRC-457. Great radio. Got amateur license, sold '457 and bought 2m handie. Years later regretted selling '457, and buying 2m handie! No regrets on the ham license though (ducking). :->

1725. Re: coax length

Newsgroup: rec.radio.cb
Date: 1999-11-11 00:00:00 UTC
From: CodysPC@Iserve.Net
Message-ID: <382a1803.7217291@news.iserv.net>
Source record: 10110

Greetings!

It deserves mentioning, because a lot of people are getting confused from it.

The Apparent versus True debate, from my perspective, is only for issues regarding Coax length being used to reduce SWR in "problematic" situations.

I do not approve the use of Coax to lower SWR when it comes to CB radios. It is for applications in a "worst case" situation that coax length can provide you with the means to be "on the air" verus not at all.

True versus apparent debate cannot apply to all, nor is this for that purpose. The evidence mounts against using coax to tune for low SWR because the coax is now involved as part of an active antenna system versus being a feedline to the antenna. This reduces performance in many cases, but increases the survivability of the radio in these cases.

Back to the message...

Baluns work like they do for the effort of running Green lights.

It's not an error.

What you call "error", can be ruled out. Do you change the length of the radiator to tune an antenna? Sure you do, you're supposed to.

When you run into problems with trying to tune the radiator, what is the problem?

Bad Coax? Possible - but Brand new?
Connections? Getting warmer.
Location? Strong possibility.
Tried using different lengths of coax? Although not recommended, can offset what the above 3 options give you in choices to make.

Apparent versus True can offer some insights as to use what you have, even though you may not get stellar results from it, you have to settle for what you get.

Coax can work a lot like a balun...

Hint...graphically...

```
-]==================--------------------|
|<--1/4 wave--------|--------1/4 wave-->|
```

Open end of coax left un-connected - with center lead 1/4 wave in
length.

Now, try this...

```
-]==========*---------------------|
|<-1/8 wave->|<-------1/2 wave---->|
```

Only now, short the shield to the center lead at the "*".

Apparent versus True, we can safely believe that the above antennas
would, or at least should, work.

But if you change the length of the shield portion of the antenna, you
affect SWR. The coax needs to be at particular lengths for these
antennas to work. They're coaxial dipoles, but are applied
differently.

They offer balanced current feeds, but use the elements differently.

Without coax, there'd be a lot of silent keys.

My first CB was a used Courier Traveller II mobile radio (purchased from EJ's Electronics in Woodbridge, Va anybody remember the place?) .....all chrome case, heavy as a brick.....great radio. Traded it for a "Black Face" Johnson to use as a base radio and purchased a JC Penney 23 channel SSB rig that was the size of a large mobile rig, but worked on both 110 and 12 volts....

By the way, if anyone knows the whereabouts of one of the old Couriers I would be interested in purchasing it.

BK.............

original CB license # KGX-6917 cost $20.00 back in 1971.

1730. Re: DISC What was or is your first CB?

Newsgroup: rec.radio.cb
Date: 1999-11-11 00:00:00 UTC
From: CodysPC@Iserve.Net
Message-ID: <382a1d2f.8541226@news.iserv.net>
Source record: 10115

Greetings!

My first "dabble" in CB's was when I had a paper route and saved up the money to buy a walkie-talkie - TRC-130[?] - 3watt 3channel WT.

Neat about these things was the ability to "swap" the TX/RX X-tals to get instant oddballs. Fun at the time, and with skip rolling in the late 70's - made it hard to appreciate it. To change Xtals was a bear, and expensive at the time.

Dropped out for a while, then got back into it in 1986. First "true" mobile I had was a Cobra 19+ and a 3' Mag-mount Barjan/Diesel Dummy load of an antenna, on a "mini" ground-plane called "Chevrolet Sprint" with the option of buying the 4th cylinder after the last payment was made. ;-)

Then I grew up...

Gradumacated to:
SS - 360 / SS - 120 FM
TRC-453
Pro640e
PC-122
Cobra 148GTL/Grant XL
HR2510
Emperor TS-5010/3010
Pro810e

Along those times I acquired a Robyn T-240D [Tube-IC-Discrete Hybird], Kraco KCB-4010 [XYLs' odd-ball], Midland 77-160 [Road Max] & 77-115 [another odd-ball].

I guess if it came to "true" love, I'd have to say the Midland 77-160 was the one I appreciated. Merely, for it's survivability in an accident that I had involving a 70+ year old man claiming the "sun was in his eyes". A few scratches and some storage, years later it still works, it's 10+ years old itself - an "old timer" by todays standards.

...[am I old or what?]...

GAWD those were some good times!

Still in it today - even with a Ham license. A lot more fun and the people a lot less complex.

I've even developed a philosophy around CB.

A CB'er will never make a good politician - we're simply too honest!

We "tell it like it is"!

By 'pointed up' do you mean vertically polarized, or aimed at the heavens? I assume the antenna is using a gamma match. Have you checked the distance from the driven element and played with adjusting it in or out? Also, how far off the ground is the antenna when you take measurements. At 11 meters, you are going to get some very different readings if the antenna is at ground level.

Do you have the schematic of the Robyn unit? I have a Colt Midnite Special 40 channel PLL which I believe is almost identical. I'd
love to get the schematic of it. It is working perfectly - perfectly stock, if you know what I'm sayin'. :-> I gather there weren't
too many made of this model, but I've seen one other than mine.

Well once again you are showing that you don't know a fucking thing.
The Zener action happens when you reverse bias the diode. A standard
diode avalanches at the reverse break over voltage, and its not .7
stupid. a 1N4004 has a reverse break over of 400 volts, but the
forward bias is still .6 to .7. Do you know the difference between
forward and reverse bias? Here's a hint dumb ass, a 16 volt zener
will break over in reverse bias at 16 volts, but guess what when you
forward bias its .6 to .7 volts. Do you have another idea what the
forward break over on a zener diode is? Put a diode across your output
and see what happens. Read up on diodes next time, you don't have a
damn clue. Elementary electronics and you flunked.
Have a nice day, and next time, do a little reading before you spew.

No you reread it dildo, Tool free is trying to tell everyone to put a zener diode across their output. Do you know what voltage it takes to turn on a zener when its forward biased? I thought not, its .7 volts. How would you say that would effect your output when you clip half of your output waveform to .7 volts? You evidently don't understand simple electronics theory do you? Get a book and READ, then maybe you will understand.

CB's are not an alternative to a cellular phone. But, it wouldn't
hurt having one with you if your going to drive on interstates. They
are more for fun with the side benefit that you can get information on
the road and occasionally be used for helping someone out. If you
listen to channel 9 for awhile you will hear the local police using
that channel to bs to each other while they are passing the time in
their cruisers.

This is my last post. Please I mean really please dont think your none educated replys have anything to do with. I know what I know, and I will find out what I dont know. I Will go through all my text books and cross out all the stuff I learned and be sure to replace it with your TOLL FREE LAW. Then I will photo copy the whole book and put my name As the author. It works with the amp builders right? lol The best thing about the whole alternator thing is that if the voltages dropps too much I'll spend a few pennies to buy some new alternators. Big deal. Or I can trade the ones I got in for a dozen of the cheezy (did i spell that right?) $160.00 ones you use with built in rectifiers that build up heat and make the alt slugish and cant be volter @ 24 volts. but since you are the master of all no educated guesses I sure you already know that right? Enjoy your Life As I know I will mine.

Ahhh, memories...

Aug. 1973 I was a little 10 yr old punk kid really getting into ham & CB stuff - didn't get the code down for another 2 years so the ham ticket had to wait. Visiting my aunt/uncle/cousins in La Grande, Oregon in the summer, I played w/cousin Dan's ("Red Dog") E.F. Johnson Messenger 223 with a Turner Super Sidekick mic along w/a nice vertical + radials antenna on the roof (2nd story). Cousin John ("Rat Patrol") had a Pace basic compact 23 ch CB (can't remember the model's name) in his Jeep that I thought was quite nice at the time.

Since I was to only use the Johnson "with supervision" (no fun there!) I would go up on the roof sometimes with a Midland 1 watt walkie-talkie - think it was a single channel (not 14!, prob. 3), with the PTT button on the *front* of the radio (push it with your thumb, I guess) and actually worked some DX when the skip was rollin' in: talked to some guy in Las Vegas very briefly before the band died. The local sheriff in LaGrande kept trying to kick me off the channel, saying it was "his" - much to the amusement of my dad, who picked up the radio and told him to get a life (and a real job :-).

Christmas 1973 my dad got the "family" (meaning me, as I was chomping at the bit for one) a Midland 13-867 radio - non-PLL, "crystalplex" w/14(?) crystals, a basic good no-frills radio plus delta tune. Put a Hustler trunk mount on w/detachable antenna whip.

We paid our $20 to the FCC and got callsign KGN-6074. My dad made me read a bunch of Part 95 - and tested me on it! - before he'd let me use the rig.

We bought it from CB Center of America (Burlingame, CA branch), who was trying to become a national CB distributor, etc. - kinda a Ham Radio Outlet or AES of the time for CB. Thick catalog w/lotsa goodies. They lasted til Radio Shack got into it big time and when the auto parts stores & Sears & Wards carried CBs at low prices - they became essentially commodity items, nothing special. CB Center of America couldn't handle the boom, and certainly didn't handle the bust when people got bored with CBs and the market reduced back down to heavy travellers, truckers and the real core CB fanatics that had always been there.

I remember "S9" magazine in those years; when I'd do grocery runs for the folks as a kid, I'd get delayed coming home because I was reading "S9" and "CQ" mags - along with Popular Electronics and Radio-Electronics,

back when those were "real" magazines - on the stand. Computer bu
was already biting ;-) Ham rigs I remember seeing in ads in 73/74
were the Hallicrafters FPM300, the Galaxy (HyGain) rigs, Yaesu FTDX
twins and transceiver, the big Swans, the Kenwood T599/R599 twins,
and of course Heath. (Our Heathkit store in Redwood City, CA was
jumping at the time.) Anyway, these rags were were fifty cents at the
time. Saw quite a few "Kris" CBs in S9 ads but never in person.
HyGain and Midland were big at the time - at least thru 76/77, lots of
full-page color ads, etc. Motorola was trying to get in the CB market
too in 76, and had some nice-looking - and probably quite good - radios.
Some of the radios were starting to sport LED displays - somewhere
around 76? 77? the 23ch to 40ch migration - mishandled by the FCC -
began.

The 13-867 was great, we used it in our travels, helped us out since
it was a good safety thing to have, etc. Another Oregon trip, I saw
cousin Dan had borrowed a Siltronix base rig (while the Johnson was
out for repairs) which was quite impressive. Several friends of the
family had Midland or Lafayette base rigs.

The 13-867 was stolen out of our car and insurance replaced it with
a 13-883 radio. This was Midland's top (or near top) of the line AM
rig, with all the bells & whistles. Can't remember if it was a 13-883
A or B model but it was still a crystalplex radio; the later '883-C
version apparently went over to the 3-crystal Cybernet PLL02A board
shared with HyGain/Kraco/GE platforms. The 13-883 we had seemed to be
nice & quiet but sensitive. Noise blanker worked pretty well. The
"AWI" (antenna warning light) kept firing - we finally realized that
the whip would loosen while driving and that it needed to be more than
hand-tight so we always kept a cheapo crescent wrench around.

Anyway, fell out of the CB racket for no good reason, got into ham
stuff (please, no flames ;-) as a teenager, schoolwork took over,
got into computers, etc. etc....

But I'm getting a new vehicle this year (truck) and I'm going to put a
nice Uniden Grant XL in it. What better way could I spend $130?

-Bill

Toll Free seems to have a big problem with Zener diodes.
If you have a 16 volt zener:
What is the reverse breakover? 16 Volts
What is the forward bias drop? .7 volts
What part of forward bias don't you undertsand?
You and)====}lllllllllllllllll}>------ seem to have a real problem
with simple electonics.
There are books that you both can read to understand how diodes work.

If you are going to quote the formulas for ohms law, use the proper
symbols, in ohms law formulas voltage is represented by the letter E
(electromotive force). E = I X R

LoL Toll free can call me a leier now cause here is another post by prozac.

Anyway I have a question?? If I go to the junk yards and buy all the parts needed to build a chevy 400 small block will it still be a chevy 400 small block or a prozac 625? Yes it is a chevy Just like X force is a dave made.

1763. just for the records Ohms law!

Source record: 10148

Current flows in a circuit due to the force of voltage appled; however, the amount of current flow is limited by the amount of resistance in the circuit. In actual fact, the amount of current flow around a circuit is dependent on both voltage and resistance. This relationship between the three electrical properties of current, voltage, and resistance was discovered by George Sion Ohm, (Where you thinking toll free?) a German physicist, in 1872. Published originally in 1826, Ohm's Lax states that the current flow in a circuit is directly proportional to the source voltage applied and inversly proportional to the resistance of the circuit. Stated in mathmatical form, Ohm arrived at this formula: Current I = Voltage V / Resistance R.

Yes you are right E is often used in place of V but Oms law uses V.

But who cares what ohm says TOLL FREE PROVED HIM WRONGE

Source record: 10150

Hey
I run a Connex 3300 with a Wilson 500 magmount. I had heard that because of the length on the Wilson 500 whip my SWR's, that are matched perfect (1:1) on CB channels, will be shot to hell when I talk on SSB. I heard that it wouldn't be too bad 40 ch up or down from CB but that the SWR's would hit the roof when I go 80 ch up or down form CB. Is there any truth in this? I haven't had the time to test it out with a meter yet, so I am just staying off SSB until I find out.

However CBers had absolutely no voice in the laws we are supposed to follow. The FCC does not answer in any way to the voters or Congress. The laws we're supposed to live by were imposed upon us by Hams and the ARRL (they're the ones who make many of the recommendations to the FCC for rules concerning the hobby bands). Hams that still to this day resent that 11 meters is no longer theirs exclusively but open to the general public. They placed those restrictions on us in an attempt to make the band unusable (4 watts is awfully weak on such a noisy band) or at least unpleasant. What they didn't expect (or perhaps they were counting on it?) was that the public demand for radio for the masses would be so great that most were perfectly willing to break those rules and make the band usable by running power, etc. Now, they're bitchin' about us breaking the rules. Some of the hams that opposed the allocation of 11 meters for CB are again rearing thier ugly heads shouting that CB has become a home for outlaws and rebels. (Who founded this country if not outlaws and rebels?) and should be de-allocated as a result of a lack of "self policing". I saw in another post were CBers were compared to those who don't vote but then complain about politicians. The problem is that until now we've never had a say in the rules we're supposed to follow. We weren't given the opportunity. Now, a group of Cbers get together and decide to start excercising the power of numbers in an attempt to change things. What do the hams do? They bitch and whine and accuse us of "trashing the house" and wanting to move next door to get away from the trash. I say the house was trashed before we ever moved in. Trashed by hams who deliberately used thier voice with the FCC to ensure that if they couldn't have exclusive use of 11 meters then no one would be able to use it.

I've forgotten the numbers, but right now there are a rather large number of people in Presidentially appointed jobs that were never agreed to by the Senate. I've written several letters to Senators asking why they haven't taken steps to correct that issue and have gotten no response. No one has the balls to stand up to slick willy.

As far as the FCC is concerned, legally, Congress is supposed to affirm any appointments made by the President. However, once that is done they no longer have any control or power over what those appointees do. In the case of the FCC, they are apparently free (in practice if not by law) to create any laws or rules they see fit without the consent of those who have to live by those rules. Vice Perpetrator Al Gore has even used the FCC to enact TAXES upon the people. A blatant violation of the Constitution.

A Radio Shack Walkie Talkie. Came with Ch 14 and two more empty slots. I remember I could only talk to one person. I got a base that Christmas (1977). A Montgomery Ward 702 and a PDL2.

Late 70's, 23 channel black faced Johnson mobile. Still have it altho the hardwired mic has deceased. It was the best talkin radio I ever owned. Up until I was old enough to drive it was used as a base powered by a battery and charger for a power supply using a 102" steel whip mounted on a roof tripod. Once I was driving it moved into my first car and was used until the mic quit working in the late 80's when I got a Cobra 25 ltd. Then I thought 40 channels was awesome. A few months later I learned of the existance of sideband and got a Rat Shack sideband radio. I've since graduated to a RCI 2950 (the orriginal ones, not those watered down versions RCI is making now and not the Mirage) in the mobile and am using an Eagle Tomahawk base. My mobile antenna is a "Whiskey Still" big open air coil antenna. On the base I'm using a set of stacked threes on 70' tower.

No, your statements once again proved me right!

"current flow in a circuit is directly proportional to the source voltage
applied"

Meaning, if the source voltage goes up, the sunk current will, also.

"inversely proportional to the resistance of the circuit"

Meaning if the resistance goes up, the current goes down.

Toll Free

>> little over their rating?
>>
>
>
>Larger pulley's on the output shaft of the alternator, testing them when
>they are cold, not running them all the time.
On my next system, I was thinking of matching the torque peak rpm of my diesel engine to match up with the peak current output on the alternator, taking into consideration the manufacturers suggested pulley ratio which I believe on diesel engines is 2:1. I could be wrong as I don't have my references to hand.

I want this as my daily driver. No shoot outs in the UK.

Is this what you do to guarantee max torque from the engine to turn those 8 alternators with minimum drag or do you match max alternator output to max engine RPM? Am I missing something?
>
>
>> Spinning them faster 'should' only generate more heat, not amps:-)!
>
>Not necessarily true.
OK, I'll accept this, even though I don't fully understand how.
>People are running 3CX3K amps on a single alternator, using a 14 inch or
>bigger mainshaft pulley, and getting full power out of them because the

God, a 14" pulley on the crank. That's a monster pulley!
>Law of physics their.
<snip>
>> I received the full catalogue from C.E. Niehoff Brushless Alternators.
>
>And what do you think?
These guys are not messing about. They seem to be looking after the

military vehicle department! Their 28V alternators are the true monsters. 400A x 28V out of the box = nearly 12kw out of one alternator = Class-C amp maybe 8-9KW of RF, yes/no? or maybe more using your experience.

That'll do nicely, make that with heavy on the onions and fries.

<snip>

>What have you seen in the Neihoff catalog.
The same as you.

From their standard range the C712 is rated 12V @ 400A. The output curve shows a peak of 425A at 8000 RPM but IMO is still rising. This is where your theory comes in - what would it do if spinning at 9 or 10K!

This rating is with the temp at 72 deg F. It shows another graph with the temp at 200 deg F where at 8000 RPM the output is down to approximately 385A.

I'm sure most people know that alternators do not like excessive heat but I think they do not realise just 'how' important it is to keep things as cool as possible.

They mention that their alternator design is as much as 25% more efficient than Lundel (claw-pole) rotor designs. I'm no alternator man. Do Leece or Electrodyne use claw-pole rotors?

<snip>
>As well as the fact that for a switcher to stay together, it has to have
>nearly 20 percent load on the output at all times.
I thought that too, but there's far less than 20% drain on the Icom PSU when the radio in on receive!
>Kinda takes away the efficiency unloaded.
>
>
>I would be interested in seeing the new ones, though. I hear they are
>clean.
I'll be back.

Hello Josuha: You left a lot of stuff out of you antenna installation here. What type antenna, matching system, how high, how close to other objects, what type coax, and how long. How is mounted or installed, on what type of mast? And what do what to do with the beam, get out better, reject others, ect.

Getting a antenna to work right can be a can of worms, a big can of worms. If its a store bought beam antenna, ya got to go buy the assembly instructions to a Tee.

Suggest you look over a ARRL Antenna Handbook, and look at the other beams at the MaCo web site at:
http://www.majestic-comm.com/maco/support/index.htm

See the M103C. These pictures and assembly instructions of the MaCo Beam Antennas requiers the Adoby software to view, but its free, and also listed at the noted site.

Let me know how ya make out.

Jay in the Mojave

I don't think anyone ever said it was only 23 channels in there... I
don't think they ever even said they wanted all of the channels
between there. Just 23 of them. Probably the ones on the lower end.

This is rated @ 1KW , the party that has these left over , but are brand new Eagle 8 (515). The person is down south but has asked to not be identifed . The amp is cream face with black case , two original Eagle meters (plate and output) still uses the original chasis and cover . All the switches on the new ones have heavy stainless switches with no lamps , has a small red led lamp for power on like the old 515 . These amps sell for $500.00 retail , $40.00 shipping
.....

Where did Toll ever mention that the diode was forward biased? I would think that you would assume that you put the diode in the reversed biased position (In order to use it as a zener). The idea is sound until you start to consider the effects of modulation. If your rig has 12V on the final collector, at a dead key of 4 watts, then (in a high level modulator) when you 100% modulate it (16 watts peak), the collector voltage will double to 24 volts during the modulation peaks. A 16 V zener would most likely clip those peaks, and square off your modulation at a much lower peak power level.

I found a schematic of a old Pace 23 channel radio that I used to own. In it they do have a zener from collector to ground. The value is 48V however..... I guess they didn't want to clip the modulation peaks, although I think they would have been safe at 30V.

>

This is all true, however you don't need to be so condescending about it. I don't remember Toll ever stating that the diode was forward biased. Anyone that understands diodes knows that zeners are used in the reversed biased position.

Let's try to keep the theory discussions a little more civil please. That way we may all learn something.....

The equation for Ohm's law can solve for any of the variable. E= I X R
is only one of them. I= E/R or R= E/I. They are all ohm's law.

If you know any two of the variables, you can solve for the 3rd. But if
you only know one, then the formula is useless.

And again, this assumes that each value for the variables remains
constant, which it rarely does in this example.

My first "real" radio (not counting the various walkie talkies) was a
Pace 223, that I got also at the tender young age of 14 on July 4th
1974. It cost me $100 back then for a radio that had nothing more than
volume, squelch and 23 channels.

My next radio came 3 month later (which seemed like a long time then),
when I sold the Pace, and got a used Lafayette Comstat 25 base. This was
a tube rig, and I had the most fun with this radio for the next 2 years.

Well, CBs are not the best tool for getting help anymore but depending on what part of NC you are in there is/was one group that monitored channel 9 in Raleigh. Don't know if they are still around.

Still way off base. More and more power is lost in the transmission line as SWR goes up, but most of that 25% will be radiated in any normal station configuration (no long runs of rg58). It is not absorbed by the finals. If the SWR is infinite, then yes, the power will be lost as heat in the transmission line- not the radio. This well documented fact can be found in any of several antenna/ transmission line matching books. Walt Maxwell's newest edition of Reflections should be out soon, and will be worth it's weight in gold for all radio operators.

TOLL FREE LOOK @ #3: Proportional meanting if the current goes up the voltage must go down. And if the voltage goes up the current must go down. IN A CONTATANT RATIO! OR IN OTHER WORDS PROPORTIONAL

proportional (pre-p�r�she-nel, -por�-) adjective
Abbr. P.R.
1.Forming a relationship with other parts or quantities; being in proportion.
2.Properly related in size, degree, or other measurable characteristics; corresponding: Punishment ought to be proportional to the crime.
3.Mathematics. Having the same or a constant ratio.

noun
One of the quantities in a mathematical proportion.
- propor�tional�ity (-she-n�l��-t�) noun
- propor�tionally adverb

Well, these are some great stories. I think I'll continue with some good stuff. After the TRC 449, I was not finished. i never gave up that radio, but I did have some cool stuff though the years, so I'll share. I had a Johnson 23 channel ssb mobile, but this is the only mobile I ever saw with a power supply in the bottom. Yup this mobile had a lump underneath that was a power supply to plug it in. Worked great. I also had I think the best radio I ever owned, a Lafyette Constat 23. Not Comstat... This was a 23 channel base with wook grain, and it came witht eh sweetest souning Turner plus 2 mike I ever heard. Well, because 23 challens was out, I got rid of these 2 radios, but they gave me a lot of fun.

> Green Dragon

What makes the band unusable IS THE CBers running more than 4 watts.4 watts is not only enough for what the band was intended for but also enough for the ilegal worldwide DXing.Besides the limit is 12 watts on SSB and an SSB signal is more efficient anyway.

I remember back in the day, the truckers were on channel 10 and somehow a agreement was made that truckers would move to 19 so as not to cause so much bleedover on channel 9, which was considered to be the emergency channel. These agreement are only among those who agree. Sideband makes it hard for a AMer to talk and AM makes it hard for a sidebander to. But to say that someone should'nt talk because a channel is reserved for Sideband is crazy. Just click to Am and tell the AMer you are talking on sideband and hopefully he will move on, if not maybe you have to move to another one of your so called sideband channel. I love sidebanding but I'm not about to add to the cb confusion by trying to police seldom used channel or call them sideband only channel..........

I admitted to being wrong about the voltage. I normally use 36 (or thereabout) devices.

Sorry for the confusion.

The moron that keeps telling everyone different just doesn't understand. He sees diode, and automatically assumes that he (we) must be using it as a rectifier.

> don't have my references to hand.

Well, in my experience, the faster you turn those alternators, the higher
the current goes. I run a stock chevy pulley on the crank, but the pulley
on my alternator(s) is only about an inch and a half in diameter. Makes
that shaft rotate like mad.

This is the same alternator that rates 202A at 18+ volts.

>
> I want this as my daily driver. No shoot outs in the UK.

We can change that, you know?

Think UK customs would let me bring my suburban in if I was to go to work
for Conoco in Aberdeen? (Scottish customs... Sorry)

>
> Is this what you do to guarantee max torque from the engine to turn
> those 8 alternators with minimum drag or do you match max alternator
> output to max engine RPM? Am I missing something?

We usually take the alternators and mount them.

There. Spin them as fast as you can.

Peak output.

If that isn't fast enough, build a nitrous motor.

Or, take the route that one of the big AC boys does... His brother is a pro
drag racer, and he gets the engines for next to nothing (comparitively).

This makes for a nice engine, built for high RPM revs, as well as
lots-o-torque for spinning the Electrodynes!

> >
> >
> >> Spinning them faster 'should' only generate more heat, not amps:-)!
> >
> >Not necessarily true.
> OK, I'll accept this, even though I don't fully understand how.

Well, I have to take part of that back... Spinning the alternator doesn't
produce more current, per se, but it will allow you to run higher voltages

at a given current level.

With that said, you can get 18 volts constant out of the alternator (designed for 14.4) at 165 amps, same as the other guy, with a slower shaft rotational speed, with lower volts.

Make sense in this regard?

> >People are running 3CX3K amps on a single alternator, using a 14 inch or

> God, a 14" pulley on the crank. That's a monster pulley!

Yes. Sludgehammer has a monster on his crank on his old Suburban. I have yet to see his new ride.

One of the DaveMade AC vehicles in Memphis last year also had a 14 or 15 inch Billet crank on his.

I will try to get some pics this year.

> = Class-C amp maybe 8-9KW of RF, yes/no? or maybe more using your
> experience.

Probably more, full field.

I see lots-more current out of an alternator when run full field, rather than running it regulated.

I don't think that a regulator can produce the voltage necessary to get the field fully energized. I am thinking of trying a 24 volt field system (running a small alternator to power the field system, then using that to run the bigger alternators) as a test. This would also allow more current out of the big alternators, as they would not have to put the field current up themselves (which can run over 7A DC)

>
> That'll do nicely, make that with heavy on the onions and fries.

I am on a diet. But no tomatoes and heavy catsup!

>
> <snip>

Loss of 15 amps? Not bad at all.

Leece Nevilles go from 200+ amps to 165 amps when going from rated to
operating temp!

>
> I'm sure most people know that alternators do not like excessive heat
> but I think they do not realise just 'how' important it is to keep
> things as cool as possible.

That is starting to happen, what with people running external rectifiers.

What some of the people running the external rectification systems don't
realize is that they can see even more current if they use EXTREMELY fast
diodes in their bridges.

I found another 20 or so amps that way once! The diodes where not fully
rectifying the AC component because they where designed for sub 150 CPS.

You can do the math... When a stator has a field energized by a rotor
spinning 10K or more RPM, what do you think the output frequency is!?

>
> They mention that their alternator design is as much as 25% more
> efficient than Lundel (claw-pole) rotor designs. I'm no alternator man.
> Do Leece or Electrodyne use claw-pole rotors?

Not sure about Electrodyne, but I do believe the Leece is the Claw-Pole
design (brushed).

I have a few radios for sale, an HR2510, RCI2950, CHEROKEE CM-5, and a Washington base station. I also have a Silver Eagle slightly used, also a Phantom 10 tube that does over 1K depending on what you drive it with. 1 Dosy test center and PDC 700 if interested E-mail me and leave your number. If you need power supplies I have trip lite pr50 and 60's thank you. I will respond to all inquiries.

1825. Re: BIG BASE AMP MUST SELL FAST!!!!!!!!!!!!1

Newsgroup: rec.radio.cb
Date: 1999-11-11 00:00:00 UTC

Wait, after rereading this....

> OK GUYS
> GOT TO GOOD THE MAN IS CLOSE!!!!!!!!!GOT TO SELL MY STUFF
> BUILT BY A HAM OP

Who gives a shit? Does that attest to the quality?

> HOMEBREW AMP
>
> RUNS .... 10 YES 10 3-500ZG EIMAC TUBES

Should run Amperex. Better tubes, higher gain, and they make a better graphite tube!

> 4500 VOLTS AT 10 AMPS

You have a 45Kw power supply?

Transformer will have to be lifted with a crane! I have a 6500 volt 5 amp power transformer and I can't lift it. Needed an engine hoist to get it out of the suburban!

POWER SUPPLY WITH 100 AMP
> POWERSTAT

You mean variac, right?

.. 220 VOLT 50 AMP BREAKER NEEDED TO RUN

So let's see.

You need 10Kw of input to get 15Kw of output! And that is with a 45Kw power supply!

Pretty good, I must say!

> THIS THING ..VAC CAPS ... OIL CAP...VAC RELAYS...
> ROLLER INDUCTOR TUNE...

Must be a HUGE roller inductor, considering what the plate currents are going to be.

The roller inductor in most all of the antenna tuners (3K rated) won't handle a single 3CX1500A7 when used in a pi network. The Q is too high because of the transformation ratio needed.

This inductor must be half the size of the RF deck, and ribbon wound at that!

Besides, with those tubes, current ratings and such, you will almost be able
to hook the plate cap up directly to the antenna!

TUNED INPUT..

Well, how the hell else are you going to drive all those cathodes?

BIG WINDOW TO SEE
> ALL THEM RED PLATES GLOW!!!!!!!!!!! " XRAY LEAD GLASS"

Really?

Page 59, ARRL Solid State Design for the Radio Amateur

(see figure on Page 60, Fig. 27)

A protective measure for unballasted transistors is seen in fig 27. A Zener diode is connected as a peak voltage clamp from collector to ground. Assuming the Max collector voltage will be twice the supply amount (comes out to 24 volts), ZD1 is not part of the circuit. However, should a load mismatch occur, or the stage break into self oscillation, the collector RF voltage will soar to high values. At that point, ZD1 will conduct at 36V and clamp the voltage above that value, thereby protecting the transistor. Furthermore, should voltage spikes occur on the supply line, the zener will clamp at 36 volts or higher, thereby again protecting the transistor. If protection from positive and negative swings is desired, two zeners can be bridged from collector to ground, back-to-back fashion. ARRL lab tests indicate that no degradation in amplifier performance results from use of Zener diodes at hf and mf, provided the diode conduction point is well above the normal RF voltage peak value. No evidence has been found that ZD1 enhances harmonic energy output."

Banded end of the Zener to collector, unbanded straight to ground.

I was wrong in the value. Been a while. Should be 36 volts (or anything above around 30). Late nights are catching up with me.

I, too, am impressed.

Best bang for the buck, in a small SSB rig.

If you want AM only, the Pro510XL is another screamer. Put a D-104 Minteman
behind either one, and you have a talker.

Did the dumb thing of hooking up my Diawa PS-50TM to a 7.8volt battery to charge in and now the thing puts out 26 volts instead of 9-12. I hate to have to throw this thing away so does anyone know how to repair it and what to check for? Should I change the variable resistor that changes the voltage? I have checked that with a a multitester and it looks bad. Any other ideas???? Thanks!!!

Toll old 747,KY should be there again this year, with a new line section
3-1/8" bolted directly to back of the box compared to the bird 43 1- 5/8"
he blew off of it last year. It will be interesting to see how he fairs this
year if he doesnt break, 3 alternators on 2-3000's in sky is kinda rough
He is going up against guys with quite a bit more oooomphh in the alt and
tube dept. perhaps he can sneak one of em... get some good pixs like last
year.. we love em...

I have already read a lot of the books, but most of what I know and believe
in is derived from my own personal experiments, which I do on a daily basis,
I tried the one with the zener diode, and I do not see any problem with it.
Not so far.

Change out the pass transistor(s).

Most likely they are bad, and are now not regulating.

On an extreme case, their is a regulator (usually an IC on the bigger supplies) that can also be bad, not regulating to the pass transistors, but I would check the big transistors mounted to the heat sink first.

And you have put the proof in this comment, man we have been here a while, we are used to it, For someone who claims to know so little, your sure do know a lot, This argument going old has happened before, I can tell you for a fact that when you test with a current meter on an amplifier using 2SC2879's you will see the current go up when increase the voltage to the amp, there is a lot of phenomenon's involving dc amps that might not make since, but will show the same in every test you make, For instance if you take an 8 pill box and key it at 3400 bird and talk it down to 1800 bird what do you think the current meter would show? I can tell you this at 1800 watts the 8 pill will draw around 200 amps, but it will draw more on key and swing down on the current meter.

******

This is great and all, but wouldn't it
be easier to just use a 14' length piece
of some quality RG-X foam (at cb frequencies)
coaxial cable and simply tune the antennas?

I use this method on a daily basis and it seems
to work very well....actually, depending on the
type of vehicle, I have had good results with
various lengths between 13' - 18' feet! I do
realize though that the mounting location and
surrounding body metal, (or lack thereof) plays
heavily into the overall results!

To account for the above I am looking at
another method. With the mobile antenna in it's
final location, (mounted) first tuning the antenna
by conventional means (your method also sounds
interesting) using various lengths in the above
mentioned range and then using a noise bridge to be
able to measure things such as radiation resistance
or impedance as well as values of inductive and
capacitive reactances........Tell me what you
think!

Jack

http://www.angelfire.com/az/firecommunications/

You wrote:

Size does matter......how to trim your coax for best performance.

Guess what? Mobile antennas are not 50 Ohms! Honest injun. Because of
this,
coaxial cable acts as an impedance transformer. So if it is anything
other
than an electric half wave (or even multiple thereof) the reading you
take
with your 50 Ohm VSWR meter at the radio end will be erroneous. This is
not
conjecture and I will not answer anyone challenging this premise.

There is an article in the latest MRT magazine that talks about the
easiest
way I know of trimming your coax for best performance with a mobile

antenna
- specifically quarter wave antennas. I'll translate how to do it for CB
radio. You'll need a radio, a VSWR meter, 50 Ohm dummy load & a PL259
"T"
connector. Attach the radio to the input of the meter - no magic here.
Attach the "T" to the output of the meter. Put the 50 Ohm dummy load on
one
output of the T. Attach a PL259 connector to your coax and screw this
into
the other output of the T. The coax should be unterminated, that is,
NOTHING
attached to the end. Key up the radio, set your forward calibration,
flick
to reflected. Prune the coax until the reflected power drops to nothing.
I
suggest trimming off about 1/4" at a time. At every electrical half wave
length of coax the VSWR will drop to 1:1. (This could be handy if you
need
more than say a 12ft run.) Take the cable off of the T, strip it back
and
solder, or screw on, to your mount. When your antenna is perfectly tuned
it
will measure an SWR of about 1.3:1 - this is totally normal, and totally
acceptable.

That's it!

or impedance as well as values of inductive and
capacitive reactances....

That is how I do it, and when it is found that the impedance is not a true
50 ohms, I design a small L network at the base of the antenna to
compensate.

******

Most mobile antennas are usually somewhere
in the area of 36 ohms. The fact of the matter
is, the extra 4 feet in an 18 foot piece of
RG-8/X foam will "add" the other 14 ohms, so
to speak. For the most part, (with some
exception) 18 feet of good grade 8M or 8X
coaxial usually works very well!

Yes I have heard of meteor skip! The meteors positively charge the
atmosphere at the point of entry.
Temporarily creating skip conditions.

Cool aaaa!

I didn't see anything that said the relay was sticking. And #12 is correct as long as you put the tape between the coil core and the contactor arm. It keeps the contactor arm from touching the core and remaining stuck there due to the magnetization of the core over time.

Hey Toll, Did you notice that he ripped off my swing kit (from www.pantherco.com) and added it to his sight under Galaxy. I made that kit years ago after experimenting with Silicon switching diodes. He even has a little diagram of the back of the board. He changed the resistor value so it would be a little different. He would be better off with my value..

Toll is exactly right.
Prozac, you say that as voltage goes up current goes down. That's based on
P=E x I
(power=voltage times current).
And assumes a constant power/wattage.

However, power is not a constant in the amp situation. As voltage goes up,
so does power.

Why does this happen?
(take notes here)

Focus on the following:

E=I x R
(voltage equals current times resistance)

R is the load resistance, which is the resistance on the C-E junction of the
power transistor. For a given input, this resistance is constant.
So with a constant R in E=I x R, E and I are directly proportional (see
definition or proportional at the end of this post).

So, if we want to solve for power, substitute E (in the power equation) for I x
R:
P=(I x R) x I
P=I^2 X R
(Power equals current squared, times the resistance)
So, increasing voltage proportionally increases the current.
Increasing current geometrically increases the power.

NOT just my .02. Do some experiments and see it yourself.
Thanks,
Josh

SWRs have nothing to do with mode,so if they are good when operating AM on the CB band they will be the same when operating SSB.

I heard that it wouldn't be too bad 40 ch up or down from CB
> but that the SWR's would hit the roof when I go 80 ch up or down form
> CB. Is there any truth in this? I haven't had the time to test it

> Mater Worm 152
> Channel 28
You will have to check the bandwidth but the further you stray from the resonant freq.(lowest VSWR) either up or down the higher the VSWR will get.Anything below channel 1 or above channel 40 is ilegal anyway.AGAIN you can operate LSB or USB and your VSWR will be the same as it is on AM as long as you stay on the same channel(1-40).Get your advice from someone who knows at least the basics,this guy doesn't even seem to know what SSB is.

Heard about 1/2 hr broadcast on channel 31
here in the PDX area (Oregon) two nights ago.
Had spoofs of President Clinton and old Saturday
Night live skits. Signal was ok, but occasional
skip stepped on the signal.

The tred in growing! I can see why some pirates
are turning to the CB band for their broadcasts. With
the increased enforcement of the FCC, it makes more
sense to move to a band that is not full of commercial
stations whining about the micro-power pirates.

1877. Re: SWR Power Loss Chart - swrloss.jpg (0/1)

Newsgroup: rec.radio.cb
Date: 1999-11-11 00:00:00 UTC
From: tnom@mucks.net
Message-ID: <cwkrOITXaRogoxplXMgVLd=M=ECw@4ax.com>
Source record: 10262

```
>>Percentage of power loss when SWR differs from 1:1 ratio
>>--------------------------------------------------------------------
>> SWR % Power loss | SWR % Power loss
>>--------------------------------------------------------------------
>> 1.0:1 0.0 | 2.5:1 18.4
>> 1.1:1 0.227 | 3.0:1 25.0
>> 1.2:1 0.827 | 3.5:1 30.9
>> 1.3:1 1.71 | 4.0:1 36.0
>> 1.4:1 2.78 | 4.5:1 40.5
>> 1.5:1 4.0 | 5.0:1 44.5
>> 2.0:1 11.1 |

This power chart above does not show power loss.
It shows power reflected. The power that is lost comes
from only line attenuation. Line attenuation from the
original journey to the antenna, and subsequent line
attenuation of the reflected and re-reflected waves.

Contrary to what is being stated by some, the reflected
power is not dissipated in the transmitter. It eventually,
minus line attenuation, makes its way to the antenna where
it radiates as useful energy. There is not even a need for a
transmatch in order to make use of this reflected power. It will
occur regardless.The transmatches usefulness is only to present
a good load to the transmitter.

Attached is a chart. The horizontal axis shows the original
attenuation of your particular piece of coax. You can figure that
out on your own.
The vertical axis shows additional attenuation in db for a given
SWR ratio.

To make a long story short if you used the top chart to figure the
lost power for piece of lossless transmission line at a 3:1 match, you
would lose 25%
If you used the attached file on a lossless piece of transmission
line the power loss would be ZERO.

Of coarse all transmission lines have attenuation losses. Let's
pick a typical loss. Let's use 1db. With the top chart we would lose
20% of the power from the original journey to the antenna. Then we
would lose another 25% according to the top chart for the 3:1 match.
This means only 60% of our original power makes it to the antenna.
WRONG.
Using the attached chart on the same system we get this. The
original trip to the antenna causes a loss of 1db. Find the 1db loss
```

on the horizontal axis. Follow it upward to the 3:1 match. Cross over to the additional loss (vertical axis) of .5 db This means that 71% of the original power makes it to the antenna.

1878. Sun spot cycle

Yeah, get a six meter radio, a yagi and point to the meteor trail.

I have been hearing a Cuban station on 27.500 A.M. lately. I listen to them on my Rat-Shack DX-390 receiver with a stock antenna in the house. They are DEFINATELY throwing some heat!

Message-ID: <80f7kf$8it$1@campus3.mtu.edu>
Source record: 10277

On Wed, 10 Nov 1999 21:54:36 GMT , mad spewed forth to rec.radio.cb:
:md>Well once again you are showing that you don't know a fucking thing.
:md>The Zener action happens when you reverse bias the diode. A standard
:md>diode avalanches at the reverse break over voltage, and its not .7
:md>stupid. a 1N4004 has a reverse break over of 400 volts, but the
:md>forward bias is still .6 to .7. Do you know the difference between
:md>forward and reverse bias? Here's a hint dumb ass, a 16 volt zener
:md>will break over in reverse bias at 16 volts, but guess what when you
:md>forward bias its .6 to .7 volts. Do you have another idea what the
:md>forward break over on a zener diode is? Put a diode across your output
:md>and see what happens. Read up on diodes next time, you don't have a
:md>damn clue. Elementary electronics and you flunked.
:md>Have a nice day, and next time, do a little reading before you spew.

Hey, guess what? Unless you can flip your little diode around 27
million times a second, that RF is going to reverse bias it through
half the cycle, and forward bias it through the other half.

Unless you figure out some other way to hook up this circuit, you
are not going to have much at all for a waveform.....

Just goes to show that the language used is at about the same level
of intellegence as those who use it.

AND TRIM YOUR DARN POSTS!

You are right... I have found that those kits do not really work as well as they claim. It depends on the interference. I have found that a good alignment will help most noisy 2950's I have also tried the Channel guard. I found that they are great in 8719 SSB radios. I put one in my Demco Satellite as it has NO rejection. It worked BUT: it made the the VFo control WAY to touchy.... For some other mods and kits for 2950's go to www.pantherco.com...

More cb myth, if the swr (singular, not plural) is OK, it is OK for any mode, (ssb, am, fm, cw, packet, anything). The swr has nothing to do with what mode you are using.

My first CB came at about 10 it was a Rat shack mobile hooked to a train track power supply and fed into a 7 foot fiberglass stick hung outside the window. You had to be careful with the power supply and only turn it up enough to get the rig to come on or the RX would crap out :)

Oh by the way I think I still have fiberglass splinters in my hands...

Might as well continue. You will Notice that CB really stands for Constantly buying :)

Next came several other Rat shack mobiles and various Cobra CB's that i cant even remember.

Then I got a President 2510. I still have it..

Then a President Washington base. The First 8719 PLL version with the "odd" board. Still have it.

A Cobra 148. Warbled bad on SSB to the point where I sold it in a week..

Grant Xl. Sold it..

Cobra 29 with major mods.. 50+ watts out.. Sold it.

Cobra 25. sold it

Two Cobra 18's. sold them..

Old Uniden PC76. Purchased for $15 to try mods on. That way I could not Mess up anything expensive. Sold it with every possible mod you could do to it and it still worked and put out 54 watts :)

Another 148 but the old style. Sold it.

Cherokee CBS 1000. Sold it..

Cherokee AH 100 handheld. Sold it..

Browning LTD mobile in great shape. Still the loudest radio I have... Incredible audio. I just wish it was cleaner on the Spec-an :) I.E cant run it into an amp as it is Dirty and reflected power is real high...

President George mobile. Still got it

Galaxy 99v. Gave it to a guy so he could give it to his kid for his birthday because he no cash and could not purchase him one..(the kid wanted a Galaxy bad)..

Another 99v to replace that one..

Browning Mark III with Glen VFO. Sold it

Another Browning MKIII with Matching Browning base linear to replace the MK III that I never should have sold. Still have it.

A brand new Robyn T123b in the box. Still have it.

A brand new Johnson Black face brand new in the box. Still have it.

A Demco satelite with all 6 pieces. (transmitter, receiver, Modulator, Speaker, SWR/watt meter, and the 500 watt amp. Still have it.

Yaesu 101ee with Speaker and Freq counter. Still have it..

A Colt Midnight special in perfect condition. Sold it as it was the same as the Robyn.

I am sure I missed a few but you get the idea.

From: rpemers@aol.com
Message-ID: <19991111172106.07988.00000101@ng-da1.aol.com>
Source record: 10288

My fault...I forgot to add the asking price for the rig. I am asking $575.
AES Sells the same rig used for $700 plus.

I have an Icom IC-728 all band, all mode compact hf transceiver for sale. Rig
is in like new condition with no scratches, scuffs or blemishes of any kind.
Never been mobile. Rig has optional AM/FM board installed. Comes with power
cord, HM-12 up/down hand mic, SM-6 desk mic, full manual and all original boxes
and packing. This is GREAT buy. I'm only selling to pay off New Knwd TS-570 SG
I just purchased. If serious about buying, email me for photos of the rig.

Buyer pays shipping. Will sell only in Cont. US. You can check out my ebay
feedback as user ID rpemers@aol.com.

Thanks,

Ron

Hi folks...

Looking for one or two nice HyGain 623s. While perfect
rigs are desirable, exterior condition (lack of dings,
front panel wear, etc.) is more important than minor
fixable electrical problems.

Please reply also to

wiese@jps.net

as I don't think I always get all newsgroup postings.

Thanks,
Bill

More cb myth, if the swr (singular, not plural) is OK, it is OK for any mode, (ssb, am, fm, cw, packet, anything). The swr has nothing to do with what mode you are using.

This is very well put. The SWR will change when you change frequency. The higher the frequency you go the lower the antenna needs to be. The lower the frequency you go the higher the antenna needs to be. Electronically, your antenna may or may not go to those bands without going over a 2. Nominal SWR is what we all strive for. For band use if your antenna is not "broad banded" and that will definatly depend on the vehicle/antenna marriage, you can use an antenna matcher to tune down your Antenna. This is not something I like to do all the time. The more things you put between your antenna and radio the more risk you run of a failure. So, the answer to the second part of your artical is that you may or may not be able to go 40 up and 40 down safely. You will just have to check the antenna between the frequencies that you are going to use and then determine if it is safe. Otherwise your favorite CB Shop does have parts to fix the malfunction that will happen.

Happy DX'ing.
Boy hope I spelled everything ok. I know the spelling patrol is about. :)

Source record: 10297

Really?

Page 59, ARRL Solid State Design for the Radio Amateur

(see figure on Page 60, Fig. 27)

A protective measure for unballasted transistors is seen in fig 27. A Zener diode is connected as a peak voltage clamp from collector to ground. Assuming the Max collector voltage will be twice the supply amount (comes out to 24 volts), ZD1 is not part of the circuit. However, should a load mismatch occur, or the stage break into self oscillation, the collector RF voltage will soar to high values. At that point, ZD1 will conduct at 36V and clamp the voltage above that value, thereby protecting the transistor. Furthermore, should voltage spikes occur on the supply line, the zener will clamp at 36 volts or higher, thereby again protecting the transistor. If protection from positive and negative swings is desired, two zeners can be bridged from collector to ground, back-to-back fashion. ARRL lab tests indicate that no degradation in amplifier performance results from use of Zener diodes at hf and mf, provided the diode conduction point is well above the normal RF voltage peak value. No evidence has been found that ZD1 enhances harmonic energy output."

Guess the idiots that do this stuff on a daily basis don't know as much as you and prozac either, eh?

Or could it be that you don't know what you are talking about?

Banded end of the Zener to collector, unbanded straight to ground.

I was wrong in the value. Been a while.

I don't have a schematic of this radio on hand but let me throw
something your way from memory.
In those vintage radios, the relay coil was often a 110 vdc
winding. To supply the coil this voltage meant maker had to provide
another winding on the power xformer or tap the hi voltage supply
with resistors to drop the voltage.
There was another way to get this voltage and I think this is
what you have in front of you.
What they probably did was use the center tap of the hi volt
xformer. In doing this they use a small value electrolytic cap in
series from the xformer to one side of the relay coil. You will most
likely find a rectifier diode across this cap to give you dc.
Because the caps impedance is relatively high at the power line
frequency only a small ac voltage is coupled from the xformer.
Judging by the age of the unit the cap is probably bad and is
not able to supply enough voltage and current to pull the relay in.
In effect the internal resistance of the cap is too high at the
power line frequency to provide sufficient coupling from the
xformers center tap.
Had you said the relay was chattering I would have suggested
that the cap was ok but the diode was bad.
Anyway, if you can trace the relay wiring back to an
electrolytic that is connected to the hi voltage center tap then you
could replace this with one of similar ratings and this should cure
the problem.

> type of response. Any help on these amps would be great. Thanks.
>
> www.coaxkid.com/python.htm

If you want a small amp that's a better than average
performer and well built, get a Silver Streak 175.
With 35 peak watts in at 14.5 volts the output is
300 peak watts on a powered, peak-reading meter into
a purely resistive 50 ohm dummy load. The unit is
very small (5.25"W X 2H X 5.5"L) for the amount of
power it produces. It uses a radial (wrap-around)
heatsink and has an electrical outlet for a fan on
the rear panel. It uses a pair of SD1446s and comes
with a mounting bracket. The downsides are that it's
unbiased (will sound a little crunchy on SSB especially
if the input signal is light) and it has the sometimes
irritating full-time SSB delay. The SSB delay on this
unit is quite a bit shorter than the one on the Blue
Face 225s and shouldn't bother the majority of users.

I hope this helps.

The optimum radiation angle depends on where you want to talk.
It's very much like a billiard shot when you think of the ionosphere
as one of the bumpers. I find that a higher angle of radiation seems
to work best for me for skip but that depends on where you are in
relation to the other stations and the height of the ionoshere at
your particular time of day. Whatever works for you.
Everything at RF is a trade-off in one way or another.

Size does matter......how to trim your coax for best performance.

Guess what? Mobile antennas are not 50 Ohms! Honest injun. Because of this, coaxial cable acts as an impedance transformer. So if it is anything other than an electric half wave (or even multiple thereof) the reading you take with your 50 Ohm VSWR meter at the radio end will be erroneous. This is not conjecture and I will not answer anyone challenging this premise.

There is an article in the latest MRT magazine that talks about the easiest way I know of trimming your coax for best performance with a mobile antenna - specifically quarter wave antennas. I'll translate how to do it for CB radio. You'll need a radio, a VSWR meter, 50 Ohm dummy load & a PL259 "T" connector. Attach the radio to the input of the meter - no magic here. Attach the "T" to the output of the meter. Put the 50 Ohm dummy load on one output of the T. Attach a PL259 connector to your coax and screw this into the other output of the T. The coax should be unterminated, that is, NOTHING attached to the end. Key up the radio, set your forward calibration, flick to reflected. Prune the coax until the reflected power drops to nothing. I suggest trimming off about 1/4" at a time. At every electrical half wave length of coax the VSWR will drop to 1:1. (This could be handy if you need more than say a 12ft run.) Take the cable off of the T, strip it back and solder, or screw on, to your mount. When your antenna is perfectly tuned it will measure an SWR of about 1.3:1 - this is totally normal, and totally acceptable.

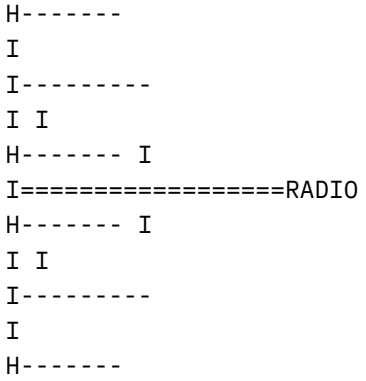
That's it!

Phase those twin truckers!
Now it gets a little complicated..... if you wanted to prune a phasing harness for two mobile whips you could use a similar trick. Except this time instead of leaving the coax unterminated you'll have to terminate it with a 37 Ohm resistor every time you trim a little off. Make sure the lead lengths on the 37 Ohm resistor are nice and short. A 1W resistor could work here - just give it really short blasts on the Tx (or use a radio with 1W output). Make sure the resistor is not wirewound otherwise you are wasting your time! Also, the dummy load on the T will become 100 Ohms from the 50 Ohms used above. Thankfully, you only have to do this prune, clip and measure repetition once. Then you can just trim the other half of the harness to the same length. Oh yeah, it would be wise to use 75 Ohm coax here (for reason I'll explain if anyone cares to know).

Phase those two Super Big Guns!
Same as above but change the the terminating resistor to 50 Ohms.Once again, 75 Ohm coax works good here. RG-6 isn't too bad. The maximum gain from co-phasing, or stacking, two beam antennas is when they are EXACTLY 0.95 of a wavelength apart - that's a physical wavelength, not an electrical one.

Once again this isn't conjecture, it's the truth.

Phase two sets of Super Big Guns.
This is actually easy. Do the above procedure but cut six lengths of 75 Ohm cable instead of just two. Phase the first two beams with two leads, then the second set of beams with two more pieces of coax. Use the two left over pieces to join the two sets together. Having trouble envisioning this? It will look like a pyramid. I'll try and draw it here. If it gets distorted try viewing it in a "reply to" window.



The "=" signs are the coax to the radio and can be any length. The "-" signs are your six pieces of cut coax and are all identical lengths. You can terminate each with PL259 and then use three T connectors.

The same procedure can be used for co-phasing 8 or 16 antennas - although you may find that you'll have to go to electrical full-wavelengths on some of the leads to reach all those antennas. BTW, the most obscene array of cophased multiple-element beam antennas this author has seen are 16 and these were used for meteor-trail communications.

Oh yeah, it is probably worthwhile to tune up each beam independantly with an electrical half-wave (or even multiple thereof) of coax (see first paragraph) before putting the entire contrivance together. There is absolutely no reason on gawds green earth that the beam antennas should have anything less than a 1:1 VSWR if they are indeed designed properly. Oh yes, be sure to wait for a snowy, windy day to install this behemoth.

Hope someone benefits from all this typing.

Greetings!

Via voltage.

Thru a bridge network. The forward, or current detected flowing in one direction, is used as the reference thru which currents detected flowing in another direction, are passed thru the bridge and this calibrated reference to display on the meter.

A Moni-match is about the complexity of these SWR meters. Very simple and only can detect stronger currents.

I'm not kidding when I say that part of the fooling of the SWR meter, arrives from the method of detection used.

Hear [or read;-], me out on this one...

Most SWR meter use two conductors spaced [some are single] evenly with the center conductor pass-thru. Allowing the field to remain thru the center wire, and conduct a field equally into sensor wires without direct connection. Ground, or shield passes thru a series of pass thru wires arranged radially or via a series of plates around the center and sensors - past the sensors. Like a Faraday shield.

Some of the simpler ones use PCB board with etched foil spacing and a slight inductive length to compensate for the conductor spacing and allow for some surface area for field radiation and detection.

How the meter is fooled is done by surface area length used, and sensitivity of components used. Smaller surface areas, or actual length used, are more likely to reside in areas of the standing waves that make the detectors own accuracy difficult.

SWR from long wavelengths are not as easily discerned, and shorter wavelengths are oftentimes reactive and the detector senses both directions at once without good isolation.

Part of the blame lies in the SWR meters own bandwidth. A greater bandwidth does not always equate to same accuracy at any given frequency. What may show up as inductive on one end of the bandwidth spectrum, can show up as capacitive on the other extreme end. A .01 uF cap for RF bypass out of a meter circuit may do fine on low frequencies, but act as a dead short on the high end.

Some high-quality units [read commercial and precision] don't use a diode, they use op amps and are set up like differential amplifiers.

Each type has specific benefits and drawbacks.

One problem, and is a big one, is the pass-thru method of detection and the surface area of the detector parts radiating and the overall ability to provide bandwidth without compromising performance and linear operation through it's frequency range.

As meters get smaller, the method used becomed compromised.

Take a look at a SWR meter section in a Cobra 148 GTL, a piece of coax, and compare that to a typical SWR meter. The GTL one is so small that surface area used to obtain detection cannot supply enough current to saturate the meter to the point of reliable detection. The forward voltage drop across the diode is sometimes greater than the surface area of the detector can obtain enough energy to generate from to pass energy thru the diode. You don't get a reading unless something is absolutely wrong. It hurts performance and accuracy.

Ok folks, don't sell those radios out...I know, I know - anything less than a 2:1 is ok, and these detectors do work for that purpose, unless you're nit-picky pur-sknickety...;-)

One meter I have in my possession uses a Germainium diode and is extremely sensitive. Can be used a grid-dip meter with an external frequency generator - of the type I don't have. It's for LW and SW band use, can't be used for HF or above. Makes an interesting conversation piece, thats about it.

1933. Re: Question on SWR's on SSB

Newsgroup: rec.radio.cb
Date: 1999-11-12 00:00:00 UTC
From: CodysPC@Iserve.Net
Message-ID: <382b64f3.1622738@news.iserv.net>
Source record: 10318

Greetings!

You're getting confused with SSB versus bandwidth.

SSB is a method, or mode of transmission and reception.

Bandwidth is a range of frequencies. You can use SSB in a range of frequencies you select by using the channel and band selector.

Your Lil-Wil antenna is tuned for a low match in the CB band, that band is a range of frequencies. Channel 1 is at 26.965 MHz and Channel 40 is at 27.405 MHz. Channel 19 is at 27.185 MHz for mid-point.

Your radios' band selector allows you to go out of this band and into other ones above and below this CB band.

SSB is a mode. You can use SSB on a typical CB radio channel. Same applies to Connex too...

The only thing you need to be concerned is the difference in *frequency* you use. SSB is a mode that you can use on any CB frequency [although you might get yelled at for it].

SWR is related to bandwidth. Or what range of frequencies the antenna is tuned for. Mode, is just how you use that frequency, or channel, you select. Channels are the frequencies you use, mode is the way the radio will operate on it.

Single Side Band - is a mode, using a very, very narrow range of audio information that is part of the channel you're on. It's not a whole new frequency. In fact, SSB mode uses just a small part of the channel that AM mode would otherwise hog up.

Yes, a short antenna has less bandwidth, or your ability to use a lot of channels above and below the CB-band will be limited.

You can use SSB on the 40 channel CB band. You can also use this mode above and below on channels you have in the other bands your radio can go to.

The only thing you need to make sure is, that the SWR of the frequency you're on, is low enough not to cause damage.

The Lil-Wil antenna, when properly installed, allows you to use 40 channels above and 40 channels below *in frequency* [don't get in confused with mode] without hurting the radio a bit.

You've got a 1:1 now, so you're fine. If you use the CB band a lot, then stick with the way your antenna is tuned now, and when you need

to "get away" from the crowd, just don't go too many bands, above or below. What mode you use doesn't matter.

And BTW - if you were checking your SWR while using SSB. Please don't, it's too confusing! Stick with the AM mode for checking SWR. Then use any mode you wish when you're done checking.

While Dancing with the Mouse on Thu, 11 Nov 1999 05:40:09 GMT, the Modem interrupted with an MNI from "jlascottys@mindspring.com (Master Worm)", and the MotherBoard buffered this to Video RAM:

As far as a schematic, I couldn't get one for it. Thats why I gave it
up.

I had it the year when they annouced tubes would no longer be produced
in the U.S. so I bailed out on it.

Wish I could help. I couldn't help mine.

1941. Re: Toll's diode question -- Answered, with proof.

Newsgroup: rec.radio.cb
Date: 1999-11-12 00:00:00 UTC
From: CodysPC@Iserve.Net
Message-ID: <382b790e.6769978@news.iserv.net>
Source record: 10326

Greetings!

Good job Toll...I've been reading this whole thread, and I only want to excersize one caution.

One thing that people don't seem to realize, the potential at the collector, is based upon a zero, or ground reference. The Voltage reference is derived from a mean, or average of the PEP which can never go below zero volts, at collector potential.

By that time, the transistor cuts itself off. But, if you use a chassis that is insulated from board ground, you only receive a portion of the protection you may need.

The second part of the Zener diode paragraph is what really should be used in a floating ground chassis, like Unidens. Dual Diode protection like the MOV used in many power line filters - work in a similar way. This way, stray RF currents that are below ground potential due to the floating nature of the chassis and matching network, are shunted to equalize potentials across the collector and emitter. A floating chassis ground is like neutral at the fusebox, a GFCI detects current that can flow from neutral to ground and vice-versa - and pops. In fact it uses a technique similar to that of what you're describing out of the ARRL HB.

The antennas own ground potential may be different, but that is why the shield of the coax is used to offer some common current potentials to remain at the same reference. Can't always apply to elements insulated from the earth some considerable height above.

Now, if the radio uses a floating chassis, you'd want to rate those Zeners at slightly below the max reverse breakdown voltages.

36 volts at 2 watts is about tops.

100V at 1 watt, Diac or Dual Zener, for direct connection to the output terminal of the SO-239 for *input* protection also helps.

[and is why Varistor Diodes work the way they do on those finals, when chassis potential versus board potential, drops out or goes more negative, the forward base-emitter bias to ground keeps the transistor bias from going overboard on class-AB, until the insul-pad or RF-cap is punctured by an arc, then toast. Clamping speed is also a factor.]

: gullibility....

Yep. And the computer makers (like the company I work for) have spent millions of dollars correcting the bugs that were created by short sighted programmers in our company who thought that their code would only be used for a few years.

There was no "intentional hiding" of the problem. There was a lot of ignoring the problem until the last minute. Many companies still have not done anything about the date problem.

There is a lot of hype and hysteria, certainly. But the problem will not be as great is the doom-sayers are screaming - as the major utilities etc have been working for a long time to clear up their code/machines. They have also put backup systems into place to handle any unforseen problems.

: > the power from this reduced efficiency has to go somewhere.
: > Guess where that is! Right! Heat in the finals! This is
: > power that never gets into the coax in the first place.
:
: It *is* due to reflected power. It *does* happen. This
: "reduced efficiency" that you describe is the effect of
: power reflected into the transmitter.

Read a text on transmission line theory - rather than going by
popular belief.

Since there is a mismatch at the antenna - the impedance that the
transmitter sees is not 50 ohms. The impedance that it does see
can be calculated by formula. As the design impedance is not
present - the finals cannot operate at designed efficiency.

The end result is the same - the finals get hot. It is just the mechanism is different than what you would think using simple logic.

: >
: > Not necessarily. The SWR meter can be fooled into producing a false
: > reading. This is the "apparent SWR" - and can be radically different
: > than the actual SWR at the meter.
:
: I disagree. Fooled how? Give an example of how the SWR meter would
: be fooled.

For one thing - if the impedance that the meter "sees" is not the design
50 ohms, then it will produce an inaccurate reading.

Second - place the meter at a current or voltage node (depending on the
meter design) and you will again get an inaccurate reading.

It is easy to demonstrate. Place a meter in your transmission line where
there is a mismatch and take a reading. Now add 1/4 wavelength of coax.
When you repeat the reading - you will find that it is different.

This even occurs to some extent on my Bird meters - although not as bad
as with cheap CB SWR meters.

: than an electric half wave (or even multiple thereof) the reading you take
: with your 50 Ohm VSWR meter at the radio end will be erroneous. This is not
: conjecture and I will not answer anyone challenging this premise.

Sorry, son. Regardless of whether you answer or not, you are wrong.
To act as an impedance transformer - the coax would have to be either
higher or lower in impedance than 50 ohms (depending on whether the
antenna impedance was higher or lower than 50 ohms.

Now the impedance that the transmitter sees will vary with coax length,
but that does not mean that the impedance is being transformed. The
mismatch at the antenna will remain the same - no matter what you do
to the 50 ohm coax length.

: There is an article in the latest MRT magazine that talks about the easiest
: way I know of trimming your coax for best performance with a mobile antenna
: - specifically quarter wave antennas. I'll translate how to do it for CB
: radio. You'll need a radio, a VSWR meter, 50 Ohm dummy load & a PL259 "T"
: connector. Attach the radio to the input of the meter - no magic here.
: Attach the "T" to the output of the meter. Put the 50 Ohm dummy load on one
: output of the T. Attach a PL259 connector to your coax and screw this into
: the other output of the T. The coax should be unterminated, that is, NOTHING
: attached to the end. Key up the radio, set your forward calibration, flick
: to reflected. Prune the coax until the reflected power drops to nothing. I
: suggest trimming off about 1/4" at a time. At every electrical half wave
: length of coax the VSWR will drop to 1:1. (This could be handy if you need
: more than say a 12ft run.) Take the cable off of the T, strip it back and
: solder, or screw on, to your mount. When your antenna is perfectly tuned it
: will measure an SWR of about 1.3:1 - this is totally normal, and totally
: acceptable.

So you are turning your coax into an antenna, then trimming it for
resonance. Big deal - that has nothing to do with impedance transformation.

i do not really know him well, he modded my cobra 148gtl in the early 90's. from what i remember, jake's was joked about by many cb' ers. i had no problem with him. his prices were a little high.

i remember 1 time going imto jake's shop, and asking about a mobile power mic for my cb, and then i said thanks for the info and left, as i am halfway to my car, 1 of his employees comes outside with the mic with the wires hanging out, saying i have this almost all wired up for you. i told them i was only asking questions and was not interested and never told them i wanted to purchase one. after that i never went there again.

i wound up getting a superstar 3900 from someone i met on the cb for $250 and peaked, and jake was selling them for $300 not peaked.

i forgot the handle of the person i got my superstar 3900 from, he lived in peekskill, NY. he was a really nice guy, once you got to know him.

The chart is about right for percent reflected power for a given SWR for any transmission line, but the chart does not mention transmission line type and frequency. There is a big difference in loss for various types and versions of transmission lines, and each one has different specs for different frequencies. This should be a hint that the chart is referring to reflected power and not lost power. Terman, Maxwell, and Smith explain this subject in detail in their published works, as well as many other RF engineers.

Wow! That's quite a collection. My own collection of "stuff" has grown
and shrunk over the years, depending on my moods. Throughout the years
my more noteworthy radios have included:

Pace 223 (First rig)
Lafayette Comstat 25 (First base, and with 25 channels)
Realistic TRC 47 SSB mobile (First SSB rig. Had very weak AM modulation)
SBE Cortez
Midland 13-885 SSB base (Traded TRC 47 for it. Was hit by lightning when
I got it)
Johnson 5 channel mobile (Became the "bicycle mobile")
Contex 6706 Linear (traded the Bicycle mobile for it)
Tram XL5 SSB mobile. (traded Cortez and Contex for it)
Realistic TRC 152 (First PLL rig. Was also hit by lightning)
Hy-Gain 623 "Utopia" (Real nice audio)
Realistic TRC 458 (Paid $15 at a hamfest for it, non working. Modified
the heck out of this rig and used it for many years)
Midland 77-882 mobile
Realistic TRC 459 (Computer base. Interfaced it with a Commodore 64, for
some "interesting" fun)
Realistic TRC 490
Siltronix 1011D
Yaesu FT101E
Yaesu FT757

President Jackson
Superstar 360
Superstar 3900
President HR 2510
Ranger RCI 2950
Icom 706
Realistic TRC 451

My current "Vintage collection" includes:
Midland 13-885 (Original from the 70's)
Lafayette Comstat 25 (Original from the 70's)
Another Hy-gain 623
Cobra 135
SBE Trinidad
Cobra 139 XLR
Realistic TRC 30A (3)

Cobra 29 XLR
Lafayette SSB50A

Am always on the lookout for memorable "vintage" base stations from "the day".

A regulated power supply typically regulated by buffering a voltage
reference, through high current series pass transistors. If you try to
charge a battery, the reverse current that can flow, can cause the pass
transistors to short collector to emitter, which will then place the
full unregulated voltage at the output.

Most likely your series pass transistor(s) are fried.

It's not a good idea to use a regulated power supply as a battery
charger.....

Exactly!

There are definite problems in the computer programs and in the BIOS's
of many machines, that cannot handle Y2K. The problem is real, it's just
not going to be the "end of civilization as we know it" doom and gloom
that some have been preaching. Airplanes are not going to fall from the
skies, the power systems will not go off-line, the traffic lights will
not go out, elevators will not halt in the middle of floors, dogs and
cats will not start living together etc.

The computers at the IRS (And other gov't agencies) on the other hand,
may be royally screwed. April 15th 2000 will be interesting......

1981. COAX LENGTH DOES NOT EFFECT SWR

Newsgroup: rec.radio.cb
Date: 1999-11-12 00:00:00 UTC
From: Bob <Bob@bob.com>
Message-ID: <382C4D2F.65493313@bob.com>
Source record: 10366

Hi Andy,

Well, I won't dispute that most SWR meters are junk.....
but there is one thing that we need to stress here to the
uneducated - I see a few posts down from some guy
named "MC 10KW Jesus" spreading more misinformation.

Like you said, SWR meters read SWR by reading the ratio of
forward to reflected power. This is what SWR is:

THE RATIO OF FORWARD TO REFLECTED POWER

This ratio is constant AT ALL POINTS on the coax. At the
feedpoint, at the radio, in the middle, 1/4 wave down the coax,
1/2 wave down the coax. Assuming the antenna system
is good (good 50 Ohm coax with good connectors) - the
mismatch is at the antenna feedpoint - where the antennas feedpoint
impedance does not exactly match 50 Ohms. This is where some power
is reflected back down the coax (how much power is reflected depends on
how
far the antennas feedpoint impedance varies from 50 Ohms).

Figuring out SWR is simple, how much power is going down
the coax towards the antenna - and how much is be reflected back
down the coax? What is the ratio between the amount of
power going forward and the power coming back? It's SWR.
The amount of power going down the coax towards the antenna and
the amount being reflected from the feedpoint IS NOT EFFECTED
by the length of the 50 Ohm coax. It's that simple.
You can sample the forward and reflected power at any point
on the coax and the ratio between the two is the same.

Throw out your SWR meter!!! SWR IS NOT EFFECTED
by varying the length of coax (I am strictly speaking about
a 50 Ohm radio into coax with a characteristic impedance of 50 Ohms,
where there isn't any feedline interaction with the antenna, also
feedline loss is minimal - no 500 foot runs of coax).

Now, empirically, most everyone knows that when they change coax length
their crappy SWR meters indicates a different SWR...I think
this is what Handy Andy is trying to say. Although your piece of
crap SWR meter does indicate a different SWR - it is lying.

In actuality, SWR is CONSTANT at any and all points on the coax.

Bob.

Hi All,
Nov.12, 1999

I have a new Ranger RG-66 for sale. I paid $310 for the unit. It is peaked and tweaked. Swings 55 watts, 1.5 watt dead key. It lists for $289.99 on the west coast. It has the freq counter jack on the back of the radio. Microphone jack is on the left side. Mod/Rf button, Rf power control, Roger beep, etc. This radio has not been used, is still in the box, with everything it came with. I am asking for $300 plus shipping and handling, payable by money order or certified check, shipped same day money is received.

Interested parties respond to Jusgd4u@aol.com

1983. Re: coax length - MC 10kW Has the answers

Thank you Bill,

Everyone seems to ignore the fact they need to tune their antennas not
their damn feedline. He could have accomplished the same effect
by using an "antenna" tuner, but I don't think he quite understands
what he is really doing.

Bob.

The only time your're going to get DX with 4 watts by anything other than accident is during the peak sunspot cycle which happens what? Like every 11 years or so? Even when there is NO one talking, daytime is nothing but 7 - 8 s-units of static. Late night is about the only time you can even talk locally more than a mile away or so with only 4 watts. People running power here in the US has absolutely nothing to do with the static and spanish speaking skip that rolls in EVERY DAY for hours and hours and hours and is all that can be heard even when sunspots are at a low. Hams can run power, so they didn't mind all of the crap that rolls in from places where the FCC has no control when 11 meters belonged to them exclusively. If they wanted to talk to a neighbor 5 or 10 miles away and had 10 s-units of some senorita from Mexico hollering "hola hola, uno dos thres quatro, quatro quatro, hola hola hola" over and over and over all they had to do was bump it down a notch and bingo, they had comms. However, CBers can't do that (at least not legally). We have to put up with friggin burito eaters plugging our ears and wiping out our comms.

And when DX is actually rolling in from somewhere that we can understand em, it's illegal for us to try to talk to those we can hear, and it's illegal for us to bump it down to be able to talk to the local folks as well. Catch 22. Two rules that combined make it nearly impossible to use 11 meters well unless you stay up late night. To get good comms in the daytime on 11 meters you MUST either run power, or talk DX (if you're lucky enough to get DX in a language you speak).

And as far as the ARRL not having any pull with the FCC. It's only logical. The FCC was about to make a decision that would impact directly on the radio hobby. Giving 11 meters to the general public without any testing requirement. Who would they consult regarding appropriate rules for such a new radio hobbiest service? Why the ARRL of course. Probably the largest such group of radio hobiest in existance (at least in the US anyways.) The ARRL is composed almost

completely of hams who just lost one of their best DX bands. Of course they're going to try and make it so that CB wont catch on by suggesting rules that make it as hard as possible to use effectively without being too obvious about it. If CB didn't catch on and remained unused they would after a time have a shot at getting the band back.

>Besides the limit is 12 watts on
> SSB and an SSB signal is more efficient anyway.

Only if ya like havin to constantly tune folks in to defeat the bad freq drift common on many FCC Type Accepted CB radios.

Actually, it's commonly called the Gore Tax. The first time it was applied, the phone companies itemized it on our phone bills calling an FCC charge for universal connectivity or something like that. Then a few months ago, the FCC decided it wasn't high enough and tacked some more $$$ onto the charge and wrote the new law so that the phone companies couldn't itemize it and in fact forbade them from telling us where the extra charge really came from even if we ask. I listen to various talk radio shows and as a result knew about the upcoming rate hike before it happened. When it happened I called AT&T who was at the time my long distance carrier and asked them why the extra charge. They said that it was to "cover increased costs." When I asked them if those increased costs were from the FCC he refused to comment. So every time you write that check for your long distance bill, there is a minimum 3 dollar charge that is in fact a tax applied by the FCC which they didn't want you to know about. It's supposed to be going toward wiring the schools for the internet. I for one see no purpose behind wiring schools for the internet as long as schools are turning out kids that can't even read. Internet isn't going to do anything toward teaching kids to read that a live teacher can't do.

Only baseless because you don't like it when someone points the finger where it really belongs. You guys for all intents and purposes made the rules we have to live by on CB. The only logical reason why we should have any power limits that hams don't have is because you guys didn't want CB to become popular so that you might get your 11 meter band back.

And don't give me that RF exposure or interferance bullshit. At 11 meters it would require gigawatts to do any harm to any living being. And the only way you'll get any bleedover from the 40 channel CB band on a ham band is if you're on a harmonically resonant frequency, at which point you'll get it even if we only run 1 watt. I don't bleed on my own stuff, not even my cordless phone since I upgraded it, and I don't bleed on my neighbors TV or any other electronic gear either. And rest assured if I ever did I'd hear about it quickly because my nearest neighbor works for the ABI (Alabama Bureau of Investigations).

it depends on how far you want to talk.
27 mhz has a limit of 4 watts where 49 mhz is limited to 100 mw.
49 mhz's sound quality is better at close range as it is fm but for any distance over 1/4 mile, i would go for 27 mhz or, at least FRS up to 1 or 2 miles.
good luck.

Source record: 10377

the only time that you may have a problem on ssb over am is if you have a problem with your antenna that varies your SWR reading with power like dirty connections or bad coax in which case when your power goes up, so can your SWR as ssb is about triple the power of am with a stock radio on voice peaks.
if your antenna is in good shape, your SWR shouldn't change from am to ssb WITHIN THE SAME BAND OF FREQUENCYS.
if your antenna is narrow banded, your SWR will go up, the further you move away from the frequency that it was orginally set for ie; set for cb and used on 10 or 12 meters.
good luck.

I am looking for some help from the radio and amp techs.

I have to replace a choke in my LA900 amp and I am looking for help locating one or for someone that can tell me the value of the choke in question.

The location of the red chokes with the white dot on it is as follows:

The first one is located directly off the first input pad on the radio so239 connection to the board.The other one is located at the large combiner on the output side, just in front of the relay .

I need to get 6 of them.

If you can help, Please respond to me Via. E-mail at: qsk694@aol.com

Thanks for your time

nunya@business.com:
<<The only time your're going to get DX with 4 watts by anything other
than accident is during the peak sunspot cycle which happens what?
Like every 11 years or so? Even when there is NO one talking, daytime
is nothing but 7 - 8 s-units of static. Late night is about the only
time you can even talk locally more than a mile away or so with only 4
watts. People running power here in the US has absolutely nothing to
do with the static and spanish speaking skip that rolls in EVERY DAY
for hours and hours and hours and is all that can be heard even when
sunspots are at a low. >>

I the 60's-70's we took the daytime heterodyne as a fact of life and
just didn't use our radios except for super-local coms. We waited until
sundown when everything was fine. Hm. I guess from your POV we should
have run linears huh?

<<<Hams can run power, so they didn't mind all of
the crap that rolls in from places where the FCC has no control when
11 meters belonged to them exclusively. If they wanted to talk to a
neighbor 5 or 10 miles away and had 10 s-units of some senorita from
Mexico hollering "hola hola, uno dos thres quatro, quatro quatro, hola
hola hola" over and over and over all they had to do was bump it down
a notch and bingo, they had comms. >>>

First of all, I can't say what 11 meters sounded like in the pre-CB
era because I wasn't there. But I seriously doubt there was any
activity by unlicensed foreign stations if it was an international
ham band. I could be wrong here, but I'm willing to bet that the band
was not at that time shared with any other service.

Secondly, you have an unrealistic view of how hams operate.
You seem to think that the first thing a ham does in the face of
interference or tough conditions is to kick on a linear and "run power".
As if power solves everything. Truth is, most hams don't even own an
amplifier and get by with a barefoot 100 watt transceiver.

Thirdly, it's been posted a million times here and you've probably read
it before so I won't bore you again with all the details, but briefly, hams
simply were not using 11 meters and when it was shifted to CB they didn't
miss it and to this day 99.9 percent of hams could not care less about the
11 meter band and don't hold any grudges about "losing it".

<<<However, CBers can't do that (at
least not legally). We have to put up with friggin burito eaters
plugging our ears and wiping out our comms.>>>

I find your POV truly disturbing. You are saying that people in South America have no right to their CB radios. But you, an American, do. As if your communications is more important - because it's in English.

<<And when DX is actually rolling in from somewhere that we can understand em, it's illegal for us to try to talk to those we can hear, and it's illegal for us to bump it down to be able to talk to the local folks as well. Catch 22. Two rules that combined make it nearly impossible to use 11 meters well unless you stay up late night. To get good comms in the daytime on 11 meters you MUST either run power, or talk DX (if you're lucky enough to get DX in a language you speak).>>>

Not a good justification for adding more noise and interference to the band and taking away other users right to it.

<<<And as far as the ARRL not having any pull with the FCC. It's only logical. The FCC was about to make a decision that would impact directly on the radio hobby. Giving 11 meters to the general public without any testing requirement. Who would they consult regarding appropriate rules for such a new radio hobbiest service? Why the ARRL of course. Probably the largest such group of radio hobiest in existance (at least in the US anyways.) The ARRL is composed almost completely of hams who just lost one of their best DX bands. Of course they're going to try and make it so that CB wont catch on by suggesting rules that make it as hard as possible to use effectively without being too obvious about it. If CB didn't catch on and remained unused they would after a time have a shot at getting the band back.>>

Paranoid fantasy. The actual facts of how 11 meters came into existence (and how many hams were its first users) have been posted here a million times. I suggest you look it up.

I have no idea where they are made.... and they are not the same as anything
I've seen......I've sold about 30 units and havn't had the first bit of
trouble yet....plus I use one myself......so it seems to me that they are
going to be some of the better rigs on the market.....
a bit touchy to convert but easy when you get used to them....

******

For all of those who constantly complain about overcrowding on the frequencies between 26.965 - 27.405. For every 10 kc. wide am signal in the band, the same 10 kc will accomodate 3 ssb signals or 2-way contacts. What will it be, 40 channels on am or 292+ channels ssb? Some of you will wonder how this figure was arrived at, this I will be glad to explain!

Be part of the solution, not part of the problem!

Which is better to use for distance AM or FM? I know SSB is better than both, but I'm just wondering if FM has any advantages over AM. I just got an Eagle Sidewinder which I'm using with an A99. I'm thinking about getting another one for the car so I can use the FM mode on the B or C band for clearer communications between the base and mobile. Thanks.

OK MR. Coax, answer me this, does trimming the feedline affect the SWR of a endfire array? and what about the phasing? will trimming the coax change the phasing? IM interested in seeing your answer this. Now we would be taking readings at the xmtr and this is 50 ohm coax.

I am selling 29 assorted delay relay tubes. These were included with a bunch of tubes that I recently bought from a retired repair guy. He claimed that these are all new/unused, but have been reboxed into plain white cartons. They appear new, but since my tube hobbyist activities are limited to audio, I have no way to test or verify them, therefore I must sell them "as-is".

I would prefer to sell the whole lot to a single buyer to make things easy, but I will consider breaking the lot up if I can't find a home for the whole pile. The list is at the end of this post.

Please make offers by EMAIL (do not post).

Regards,
Tom Mitchell

If the ARRL and hams have as much pull with the FCC as you claim, how did they lose the 11-meter band to begin with? Obviously, they didn't have enough pull to prevent the loss of a whole band.

Or, perhaps the ARRL/Hams do have the pull, but really didn't care that much for the 11-meter band? Of course, that would shoot down your argument about imposing limits on CB in an effort to get the band back.

Either way, your argument is wrong. You should try to listen to your arguments a little better before posting. They simply don't make sense.

By the way, why do you keep repeating that the 11-meter band was one of Ham's best DX bands? That is total nonsense. The 20-meter band is, and always has been, the most popular DX band (followed closely by 75/80). I doubt the 11-meter band was even in the top ten.

> tuning?,.............icm out........

The MFJ 259b is great-- use mine every day-- highly recommended..........

Now, here is something else to think about over the weekend (I have no computer
at home).
What if I told the group here that I have a way to construct an antenna that :

- is tuned with the length of it's transmission line
- is relatively easy and inexpensive to build
- will handle high power
- uses no tuner or transformer
- will cover all 40 cb channels
- is as close to 100% efficient as any antenna you will ever build
- low SWR
- can be designed for ham or cb
- few drawbacks

This is one of the neatest tricks I have ever seen in all my years in radio,
but few operators (ham and cb alike) have ever thought about it. It is not for
everyone, and it has some drawbacks (you figured that didn't you?). It is not
my idea, but it's very simple. This antenna is all I use at home, seven days a
week. I am not selling anything, and Monday I will post a website with all the
info needed to construct one. Also, I'll list all parts needed and prices from
my AES summer 99 catalog.
Try to figure out how an antenna like this could possibly be, and I'll post
all the drawbacks that I can think of Monday morning (11/15/99).
Have a good weekend and 73.........

Agreed. If anything is kicked in, it is a host of filters (narrow, notch, DSP, etc.). If that does not work, there are always other frequencies (that frequency will be better another day).

In fact, my big project for next year is a little EME (moonbounce). I'm going to try it with only 100 watts on SSB. I'm hoping a good antenna system (in the design stage now) will make up for the relatively low power. I'll consider more power only if that does not give me the desired results.

Even if everything you say here is completely honest (and I doubt
that), even you would have to admit that this (interference) is not
typical for the average person running illegal equipment in the CB band.

Howdy Ice

I've never used the MFJ259B but I have used the Anritsu Site Master. This baby measures return loss from 5MHz to 1.2GHz. It plots these boss lookin' graphs that you can save in the memory. This can be really handy if you are trying out a number of different antennas on a standard antenna mount. It also costs about 20 times what the MFJ does. In my experience MFJ products are pretty low quality. However seeing as VSWR is a voltage ratio I guess it is pretty hard to screw that up. Armed with this tool I would tune the antenna right at the antenna, if possible. I think they are worth about 3 bills and this is probably a good deal.

I think the group is in agreement that a mobile antenna is not a naturally resistive 50 Ohms.
It you do this you are introducing reactance to your antenna system. When you have reactance, capacitive or inductive, you will lose bandwidth. Now before you jump down my throat, I admit this is not a big issue with +some+ users.

I remember when I first learned about this. I just about blew my top.
For those people who are getting a bill every month from AT&T and do
not want this, call up AT&T and tell them you do not want to be their
customer, and you absolutely do not want to receive a bill from them
each month. This will put an end to it. The next time your make a
long distance phone call you can just use one of those special dialing
codes like 10-10-321 and pick whatever long distance carrier you want.

This tax is a total scam.

Universal Service Common Carrier Bureau

Universal Service

What is Universal Service?

This rulemaking was initiated to define the services that will be supported by Federal universal service support mechanisms; define those support mechanisms; and otherwise recommend changes to FCC regulations to implement the universal service directives of the 1996 Act. These directives are intended to promote the availability of quality services at just, reasonable, and affordable rates; increase access to advanced telecommunications services throughout the Nation; advance the availability of such services to all consumers, including those in low income, rural, insular, and high cost areas at rates that are reasonably comparable to those charged in urban areas. In addition, the 1996 Act states that: all providers of telecommunications services should contribute to Federal universal service in some equitable and nondiscriminatory manner; there should be specific, predictable, and sufficient Federal and State mechanisms to preserve and advance universal service; all schools, classrooms, health care providers, and libraries should, generally, have access to advanced telecommunications services; and finally, that the Federal-State Joint Board and the Commission should determine those other principles that, consistent with the 1996 Act, are necessary to protect the public interest.

November 1999 High Cost Items

Well, it's fine to say what ever you want,
but doesn't necessarily make it true. I have
used this method to match an 83" Solarcon
Thunderbolt and am able to cover 3 Mhz of
bandwidth and never see over a 1.7:1 swr.
The feedline ended up being 18 feet of quality
S.I.W. RG-8M. This worked the best in my
particuliar application as the antenna is
mounted on the center roof of my 79 chevy van.
Measurements were made with a MFJ 259B and
a Palomar Noise Bridge. Couldn't have gotten
any closer if I had wanted to.

Jack

In an RF amp, no.

When you increase the current on the base, the current on the collector increases, also.

This is a law of operation on a transistor. The more you turn on the base, the more the collector will conduct.

Sorry, try again.

The FM band will help you pick up the signals in the noise, but AM signals
you can always go to SSB mode to RX them and get better S/N ratio.

Also, SSB is the best mode for getting the maximum distance.

Toll Free

I beg to differ.

Your site is 100 percent useless... That I agree with.

Bigradios may be nonsensical at times, but it is not useless. I have brought quite a few people into the CB keydown scene with that site, given others who wouldn't otherwise have been "in the know" about them a chance to see what they are like, and exposed still others to something new.

What does your site do?

Tells us about your network of friends... Fine.

Post mods that others have posted on the internet... Who cares.

but atleast the pictures on my site are of my own stuff not
> some stranger at a key down that doesnt even know you exist on this planit

Really?

That is why we have special appreciation trophys from nearly every break we have attended, right?

That is why the clubs have listed us (Shadow and myself) as "special guests" at a couple?

That is why when Shadow and I walk into the Saturday ball, we are announced? (not that we are the only ones, but this is far from the norm)

That is why when I am on the bowl talking, people that run breaks are asking me to come to theirs?

That is why some of the break sponsors are asking us to do web sites for them? And, helping to pay the trip their?

I make nearly every break in the southern region.. I will guarantee to you that I have made more than you in the last year. Their are breaks that we have been to that have never been put on the web site, just because we didn't have the time.

Nearly once a month, I pack my family up and attend one of these functions. I enjoy it, and judging from the hits to my web site WORLDWIDE, so do some others.

In the future, I would ask that you don't bring bigradios.com and your site in the same sentence... Like comparing apples to oranges.

My site covers the events.

Yours covers your friends and yourself.

> or did you have to pay to take them pictures?

Actually, in some cases, it works the other way.

You are an insignificant little crack. I realize that with the last comment made.

I suggest you ask some of the people from Memphis on west about Toll Free and Shadow, and see what they say to you..

Then, ask them about Prozack.

At that point, they will more than likely hang up.

> to one.

Let's see..

You have been to one break.

You have never run anything over 16 pills.

But, you seem to think that you know everything about a linear.

How nice.

An uneducated, inexperienced asshole that can tell the rest of the world how
everything works.

If you pack your family up once a month for CB radio you are a
> loser.

Why? My family enjoys some of the breaks, and the ones that the kids don't
like, they don't go?

I guess I should be like you, and tell my family (doubtful that you have a
wife and kids in the first place, judging from your attitude) that CB radio
is not for them, and then I should go to the break by myself!

Of course, if Yummy is going to be their (Concrete Man's better half), maybe
I should leave the wife at the house! hehe

Is that the best thing you can come up with for a family event?

No. On top of that, we also take vacations every year, my youngest boy
races Methanol running go-carts, my second oldest is getting involved in
dirt bikes and my daughter is playing basketball.

I live a very happy life, all my kids enjoy going to the breaks, as well as
doing their own thing.

I suggest you get a family before you base on another mans family for doing
something they enjoy!

See
> ya around.

What with you only attending one break, I seriously doubt it.

But how can an X-Force now be called a DaveMade when the input network is changed, as well as coming with a proprietary bias circuit in them?

That would mean that all amplifiers are DaveMades...

Or that Dave is a Marko, since they made class C boxes back in the 70s, as did Palomar and a couple other manufacturers.

So, what is the "Real Deal" (is his a Dave box, too.... Since basically anything that is class C is now a DaveMade, even when you change two MAJOR items in them) with this...

Seems like it is time to grow up about the whole thing.

Who really gives a $hit anymore, anyways?

I just had an interesting one at work:

We use IBM AS/400s and older IBM Mainframe computers, with dumb TTY terminals on them.

The software is programmed to have the users change their passwords every 90 days.

When that hit in October, we had a problem. The date of the next password change was in 2000.

As soon as the user changes their password, the computer logs them out, and they have to log back in, only this time, THE PASSWORD WAS EXPIRED, as the computer didn't translate to 2000 correctly, and the software was under the impression that the persons password had expired.

It was very tricky and laborious to get it back up. The programmers are still fixing it... We just disabled the every 90 days (upped it to 120, actually) password change, and business as usual.

These are the kinds of things that will happen.

A quicker way might be to check the base voltage on the any of the
big, pass (output) transistors. If the base voltage is normal, the
problem is shorted pass transistors. If the base voltage is high,
the problem is in the driver transistor or the regulator IC. Measure
the base voltage on the driver. If it's normal, the driver is
shorted. If the base voltage on the driver is high, the regulator
IC is likely to be bad. Unless you have a voltage chart for the
regulator, the easiest thing to do is to substitute a known good
regulator IC. Most manufacturers provide a socket for the regulator
IC in order to facilitate servicing. When you get it working again,
chart all the key voltages so it'll be easier to troubleshoot the
next time.

Almost all radios use the shunt type AMC circuit these days.
To find the limiter in a new radio, trace the mic audio line
from the radio's mic plug, through the mic gain control (if
used), to the main board, and along the main board until you
come to a transistor that has one leg in the mic audio signal
path and another at ground. More than likely that is the
active device in the AMC circuit. Removing it will completely
disable the AMC circuit.

I've used this technique a number of times on very new model
radios and it always works. The transistor you're looking
for is almost always the first one you run into along the
mic audio signal path. What that means is that it shouldn't
take you very long to find it. I usually have had to do it
while the customer was waiting, and I've never had a customer
complain about it taking too long. Even if it's the second
or third transistor down the line, it shouldn't take you more
than 15 minutes to find it and remove it.

> P.S. Any rebuttals will be ignored as pure nonsense!

Ok, lets start the nonsense <G>

40 channel * 10 KHz = 400,000 Hz

400,000 Hz / 3 = 133 1/3

If the other sideband could be used at the same time = 166 2/3

If a station is on USB every 3 KHz (skipping the "A" channels)
you can fit 133 conversations on the band.

Example:
CH 19 = 27,185 KHz
3 Khz bandwidth takes you to 27,188 KHz.
Now if your on 27,185 KHz on USB and I'm on 27,188 KHz LSB,
we're on the same frequencies. We'll sound inverted to each
other. The low voice freqs will be high and the high voice
freqs will be low.

Where's the 292?

Bill:
Have you seen one of these "ext. spkr. jack less" pieces of junk ? I've been doing it for over 20 years & never seen trash like this before. It has MINI (very mini) transistors mounted on the FOIL SIDE of the board !!! I ain't gonna take the time & unsolder every one til I find it, because I'm afraid of breaking them , since they are so small. But I like your finding meathod. I sold the guy a used 78 instead & told him to have his wife use it! I may see it again, so I'll try your method IF I see it again. I can usually tell by looking @ it, as to which part it is. I KNOW it is on the foil side, & 1 of those wee little biddy transistors is it--but which one ?
Dave

Even with lsb operation only there would be
from 133 - 146 channels instead of 40 - 45!
A little over 3 times the available bandwidth
compared to exclusively am operation!

Jack

>>
>> if I were you I would change it all over to 72 mhz

I wouldn't worry about interference with R/C cars. Boats I would,
aircraft definitely. I used to have a couple R/C aircraft and it's
not pretty when someone's transmitter takes a hit from another
transmitter or other interference. Fortunately it never happened to
me, but I witnessed it a couple times. One was destroyed after it's
sudden impact with ground, the other flew off into the wild blue
yonder never to be seen again by it's rightful owner. Bad way to lose
three or four hundred dollars.

The ham frequencies for R/C are definitely the best way to go. Not
too many people use them so you hardly ever have to worry about not
being able to fly/drive/boat because someone else is already
transmitting on your transmitter's frequency. If I was still into the
hobby, that alone would convince me to get a ham license. The club I
belonged to had well over a hundred members and on Saturday and
Sunday, there was always a big crowd at the field. One guy in the
whole club used the ham frequencies. He could fly whenever he wanted.

My math is fine, my fingers aren't! <G> I meant 266 2/3 not 166 2/3.

You cannot occupy the same frequencies with USB and LSB at the same time.

Everyone will have to use either LSB or USB. Read my post again. The
part about the speech inversion. You can descramble an inverted speech
cordless phone with a WT and an SSB CB.

Try this: (I figure you've got a digital tuned VFO radio)
Find an SSB transmission. If it's USB, increase your freq
by 3 KHz, switch to LSB, attempt to tune them in. Go 3 KHz
down and switch to USB if they're on LSB. Let me know if
you are successful in tuning them in. If your radio has good
filters, you won't.

Previous post requote:
>40 channel * 10 KHz = 400,000 Hz
>
>400,000 Hz / 3 = 133 1/3
>
>If the other sideband could be used at the same time = 166 2/3

This would mean that Texas Star is Palomar...

Except the Class C models.... Those would be Prides.

Still doesn't jive. When someone learns, the mentor should be happy they
left to make their own product...

ESPECIALLY if they improve upon the design. That means that the mentor made
him into something, rather than taught him how to copy part values.

But who cares.

What's up with this????
Don't go blaming Toll for the FCC bull !@#$..... go after Rick Bullon and John John whatever....ski the lame wanna-be-fcc-cops or better known as the Ham Supremacy.

I created that page two years ago and it has been talked about for just as long on Channel 6. I took the locations away so the Ham Supremist's would not bother us. You know, show up with their guns (Like John John wants to do) and Rambo us all away! I have no doubt that the FCC has been to our pages and also there is no doubt in my mind that the FCC has been to our functions a few times. There has never been any damage done because of our web page. If anything, it brought hundreds of people closer together and they made a lot of new friends. So pay attention to what you say and what you accuse someone of before you write.

Those messages sent to the FCC (if they ever were) were all bogus threats and the FCC only would respond with a form letter. We are not afraid of them. We know the source of their hatred and anger. It is not with us. They are just using us as their scapegoat.

You still want that link to your site on Toll's??????

hhhmmmm

I know some that were, and according to them the interferance from
south of the border was just as bad on them as it is on us now.

> Secondly, you have an unrealistic view of how hams operate.

Not according to the old timer hams that I've known. It was used a
lot for shooting DX because it has more frequent band openings that
most other bands.

> I find your POV truly disturbing. You are saying that people in
South America

Heheh... gunna try to twist something around aren't ya? I never said that they didn't have a right to talk. However, they don't have any GREATER right to talk than I do. The problem with them is that they have virtually no restrictions on the amount of power they can run. All I want is to be able to do the same thing you guys do. Run the least amount of power possible for clear comms. Day or night. Here is a brief description of how I and nearly every other CBer I know runs thier equipment. If conditions let me get clear comms with half a watt, great, that's what I use, the amp stays on standby. If conditions require 4 watts, great, I roll the radio up to that point. If conditions require more, I turn on a small driver amp that gets me just a tad more, something like 30 watts PEP. If that's not enough for clear comms I flip that stand by switch and let the 6 pack of 6LF6 tubes to thier thing on the low side. If that's still not enough then we go to the high side. If conditions clean up and it sounds like I can get away with lower power again, then the entire process starts over and I drop wattage as far as I can and still have clear comms. At max power, I can crank 1.5kw out of my stacked threes. And guess what? I rarely have to go that far. It pretty much only happens when we have someone on the channel deliberately trying to disrupt comms. Under the worst natural conditions, I can get by with about 100 watts PEP which I can attain with only my driver on high stage.

> <<And when DX is actually rolling in from somewhere that we can

If it's good for you guys it's good for us. According to the ham test study book I have even the no-code tech class hams can run 1500 watts on all bands they have rights to if such is needed to get clear comms. I fail to see any difference between that and what the vast majority of CBers who use amps do. Contrary to what you obviously think, not every amp using CBer runs a "splatter box" as I've seen em called in this NG. If I look up at my modulation meter and it's going over into the red it's time to retune my equipment. I've got neighbors who run CB's less than a mile away, and even on the rare occaisions that I run

max power they never get any bleedover from me. That's because I like most amp users, run my equipment clean. Stopping all amp usage just because some few morons run amps with several 500Z tubes driven so hard that they throw purple lightning around inside the glass is just as stupid as banning high performance automobiles just because some few morons can't seem to control them and keep wrapping them around trees or other people.

> into existence (and how many hams were its first users) have been
> posted here a million times. I suggest you look it up.

Facts as far as what was made public. Think about it. It's plain human nature. You never miss something until it's gone. Even if as you say 11 meters wasn't used that simple fact of human nature still stands. Look at any one of the millions of children in this country. Give one of them a toy. If he doesn't like it he wont play with it. But let some other child come by and pick it up, the first child will pitch a fit about the other child playing with his toy and will try to take it back. If the parent or person in authority over the children makes the first child let the other one play with the toy he'll cry and whine about it and try to think up ways to get it back without getting in trouble with the authority figure. That's exactly what's been happening between CBers and Hams since 11 meters was allocated for CB.

>did they lose the 11-meter band to begin with? Obviously, they didn't
>have enough pull to prevent the loss of a whole band.
>
key word here is "didn't". they've obviously haden't learned their lesson with cb. when ups became a threat, they jumped on their minute man horses and tried to come to the rescue there too.
politics were different in the 50's when the cb band was born.
in the last 40 some years the ARRL has had a lot of time to hone it's lobbying skills in congress and the FCC as well as the probability that their numbers have grown somewhat since then with more politically active members also.

>You should try to listen to your
>arguments a little better before posting. They simply don't make sense.

neither did the one posted earlier this week by the ham who threatened the guy with the wrath of the FCC. he asked a question about a linear.
the only problem is that the guy's e-mail address clearly stated that he was in the U.K. clearly out of reach of the FCC.
the last time i checked, the FCC wasn't an arm of interpol. or is the ARRL trying to get that changed too?

>By the way, why do you keep repeating that the 11-meter band was one
>of Ham's best DX bands?

by the way, why do the hams keep repeating their complaints about cb'ers doing dx on cb? jealous?
if 20, 75, and 80 meters is so good, what the hell are all of you doing up here in this, admittedly, no good band? why aren't you down there having all of the fun that we can't possibly have without having us bother you?

Greetings!

You had to spill the beans, play the trump card, let the cat out of the bag, beat it to the punch, describe the ending chapter of a good book on how it ends, be a magician telling the tricks of the trade, secrete the secrets...e&c...

I'm glad to see this type of response from people over the idea...

Dammit! - Er, Gosh Darn It!

I've been playing around with this item [dummy and tee] for about a year now - and I'm currently working on VF using different metals using this trick. Got it from [ulp] an older ARRL article someone photocopied for me.

And this method of parallel, which I tried and liked, is why I received a lot of flames over the topic of impedances that exist on a transmission line.

A key-word? Sweet Spots - meaning the better locations on a vehicle for mounting the antenna due to SWR performance before tuning.

For the circuit can be drawn two ways.

You have a series impedance, and a parallel impedance. Combined, both give you overall, or Characteristic impedance the system appears to have.

The method you describe is more along the lines of parallel impedance, using a 50 ohm load, and a complex impedance of the coax. You simply trim the coax to show close to infinite as possible, and with this ruling of parallel resistance, you only see the 50 ohm load, or close enough to that, once the coax is trimmed to show infinite impedance.

Either way you look at it, an SWR meter in-line with the coax, is more like the series circuit, detection of impedance in series with the coax. The patch cord offers a variable in the length.

The T fitting, referenced to a dummy load, gives you a parallel measurement across a known reference of resistance, at that point on the coax.

What is strange, if not peculiar, about this arrangement, is what you see at the meter between both types of measurements. Both are about equal in length of coax once done, with minor adjustments to length between both series and parallel measured/trimmed types of coax for that particular application. The series one needs the antenna, while

the parallel test requires only the mount to be at the antenna's location. The antenna is mounted afterwards.

I'll keep the hints you gave about the Twin-truckers [co-phased], that is a good one to remember.

The part that burns me is, once you've trimmed coax, the antenna needs very little tuning right out of the package. So the seals can remain in place once everything is mounted as per instructions - but alas, the owner looks at it differently...;-)

One strong hint in the favor of trimming technique, is the sheer bandwidth this provides. When you think about the overall lenght used for the whole system, you'll understand why the bandwidth of a system with adaquate ground works the way it does. The longer the antenna, the greater the bandwidth it can provide for tuning, even though the antenna itself is very small. It's not the read bandwidth of the antenna here, it's the overall length and surface area of the system that provides this.

The method I use is a little backwards to your description, the "parallel-type" as I call it. It's for permament-types of mounts where I use the mount as the "fixed" end and the parallel or T-fitting on the trimming side to the radio, with a simple check using the SWR meter in-series afterwards.

To set-up the initial tuning;
With the mounts' connector established and mount installed, I use a "quick, spin-on" PL259 adapter that mates with RG-8X or the smaller RG-58, for trimming the proper length in Semis. The trimming is done at the radios end, and you tune to what the mount sees. When finished, the connector is hand soldered on the trimmed end that goes to the radio. The remaining slack is not a bother to the customer, er - sometimes [another story for later ;-]. Finger cuts from Utility knives not included...

To me, series method is much more effective in using the mounting location as the final determination of SWR. The mounts' own response plays a role as well as the antennas. This way, any errors show up immediately without having to wait until afterwards.

To demonstrate to a customer, and to obtain an idea of how SWR will be affected, I use two types of tools with an SWR meter and a Hand-held "Help" radio with the Motorola adapter. A quick hand clamp for Semis, and a mag-mount with felt, both use 18' of RG-8x. An El-Cheapo Francis or a simple Base-load whip also gives the owner, and myself, an idea of what we're up against.

Personal vehicles? I use the mag-mount at various locations to give the owner an idea of what an antenna would look like on the vehicle at various locations, and also for myself to obtain the lower SWR readings at key locations that I would prefer to mount the antenna at, or at least let the owner choose and select either the mag-mount

option [most do] or permament. To be used in or around that area on the vehicle.

As far as choices, some prefer the more exotic [as I call it] Dominators or Penetrators [some just like big coils I guess]. Some like a slim-line appeal of the Francis, but Francis types are tricky and are better off in performance if you trim coax versus the whip to reduce splitting and water-entry due to the fiberglass sheath protecting the coil-wind. Others select Firestik, myself included, but I suggest using a permament mount for them, due to the heavy-solid core and amount of copper on these types.

A few that use Firestik, switch over to a lighter antenna like the Francis once they've learned the lesson of having to chase after the antenna once it's blown off or knocked over on a mag-mount. [Sigh]

Semis pose a different type of problem, it's not looks, but the best location to mount. Almost all prefer mirror side mounts. Not a tough job, but a minute deviation of an inch too close or away from the cab and side pillar, and the SWR can skyrocket. But, once mounted, a piece of electrical tape on the bracket tubing for reference and they can have little problems, or worry, about SWR afterwards. Some need to take it down to switch cabs or shift-workers. Put it right back at the same spot, you're 10-8.

Works quite well and have litterally no complaints. I do a lot of leg work, but if it doesn't have to be re-done, you and the customer are satisfied.

Oh well...Thanks for sharing this...you've helped redeem some of the pain incurred over the flames...

You turkey! LOL! ;-)

From: CodysPC@Iserve.Net
Message-ID: <382ce493.6698399@news.iserv.net>
Source record: 10456

Greetings!

[From a buyers point of view]

Well, I like it, but I don't...at least I can't use it for the purposes I thought it can do.

A Faceplate a lot like the 148F or the older [read older] SS Saturns.

I like it for what it can do, it's just not an "everyday" radio for commutes in a noisy mobile.

Some flaws, but then I guess I'm happy with a PC-122. If you techs out there can take a note or two, look at the center portion of the board. You'll see a lot of after assembly re-work due to errors in etching the foil traces and mine must be an early production model. Lots of clips and re-soldering of jumpers to make the radio work [rear portion and at mic-input and at connex board]. A caution for others that are curious about the first-off-the-line reports.

So, what the h*ll am I doing with a radio like this? At least I have one, and these things can work, and hard. But are sensitive to vibration and maybe not a good idea to have something this expensive bouncing around on your dash or floorboards just to tease others with echo or to hear yourself with the talkback.

My main complaint? I just don't like the "oversensitized" receiver that this thing has. Picks up Mouse-Phartz from Europa. Schottky diodes in the ANL and NB - with no ability to toggle just one or the other noise reducers - adds noise on their own, and the feed-forward RF-preamp Varactor tuner is a novel application for such a radio.

RF and AF clipping can make a voice sound a bit different, some audio compression is occuring on this radio. And with the addition of the Connex board as a Mic-preamp, this radio makes me wish others used this type of signal processing for their audio. Things would be a lot different if others use this method. Makes Cobras' ST look tame!

Lots of knobs to play with, converted the clarifier, peaked out the Dual-finals. Is capable of a lot more power that many realize.

It's a lot of radio, but the price to me was too high. The built-in noise toys are embarassing to use in some circles. But is outstanding on SSB performance!

Nice little radio to tinker on, with a big price tag.

Maker? RF Limited.

Same size as a GrantXL/Cobra148 chassis...

Similar to? Galaxy 99 [many of the components in AM mod section use
parts and layout like their chassis; M4558 Mic amp and dual 1969
finals, single 2166 driver. Got the thing to work 30 watts AM RMS with
forward swing, close to 50 watts on SSB - but gets hot and unstable.
Put it away when it washed out the TV...;-]

2081. Re: COAX LENGTH DOES NOT EFFECT SWR

Newsgroup: rec.radio.cb
Date: 1999-11-13 00:00:00 UTC
From: CodysPC@Iserve.Net
Message-ID: <382cf541.10969269@news.iserv.net>
Source record: 10457

Greetings!

This still does not address the issues surrounding a system that has radiating signal-loss due to poor ground provided at the mounting location.

This is my beef.

When SWR is changed by trimming length, the coax is part of the antenna, it's not just a feedline anymore.

That is the line in the sand, where I say, "Yes, it does!"

Another facet of this, that no one seems to want to think about, is the fact of using an SWR meter, and swapping out with different lengths of coax, can prove you have a properly operating system. If swapping coax changes SWR, we have a series of problems.

Has anyone ever thought of the lowly ground and it's own problems in working with an element thats always gotta' be on top? Hey! Grounds' got rights too you know!

Theres' two parts to every circuit, and Ground is oftentimes neglected to be accounted for, and a lot of people are left scratching their heads as to why "this thing worked fine at the store! I don't get it!"

Poor Ground? Either by Bad location, or Mounting? You still force the coax to work as part of the antenna, it's an active part of the antenna when you need to trim coax. This pertains to both the element and the working ground it's up [or down] against.

When you have the correct mount, properly mounted at the *best* location, the only problem you will have is how to keep it from rusting.

As said earlier, and I will re-iterate. This debate is not addressing the problems associated with mounting location and proper installation. In a crappy set-up, the coax cannot decouple itself from ground at the antennas location due to physical contraints placed on the antenna by the owners desire to use the antenna at that particular spot versus another ideal location that will allow the owner to use any length of coax to provide for the needs of simple connection.

How many times do I have to explain that?

Once people get a clue that the *reason* a 50 ohm antenna can't present 50 ohms all the time, is due to the working counterpoise not making the element act like it was 50 ohms to begin with.

Coax can provide the means to act as a feedline, or become an active part of the antenna system - period.

If trimming the coax solves the problem, then the owner is at fault for not properly positioning the antenna, mounting the right antenna, and/or using the proper mount for it. They have to settle for what they get!

I'm sure that when you search Deja-news regarding the antenna situations people post about, that I reply to. I'll say pretty much the same thing each time.

"Use what works for you." and "If you need to trim the coax...", or, "if you put your antenna there, you have to settle for what you get."

Now, if both the element and ground were working together, like they should - the SWR debate ends. People just don't understand it when I say "Don't put the antenna there just because it looks cool! Because, your life may depend on it someday."

"What good is a big-$$$ radio running a pretty antenna at a cool location if it don't work worth a crap?"

Now, once the ground an radiator work properly, the coax acts like simple feedline.

It's when ground and the radiator present their own reactances that can't leave just R in the R+/-jX problem - we have a situation that the coax now plays a role in acting as a complex and unterminated cable that throws itself into the R+/-jX problem by acting as an active antenna itself with it's own impedance. This then can be conjugated by trimming itself to meet these other reactances to leave just R.

Whats' so disheartening is this "Trim" crap that arises when someone like myself admits to looking at a problem two ways - Series and Parallel circuit forms.

10KW Jesus is dead on the money for what he describes. I've accomplished the same thing but for different reasons with a totally different premise - effects different metals have on Velocity Factor, or RF conductivity to meet the ideal wave in free space.

From my own experiments with the limited budget I have, I came across testing ideas based upon antenna project books that 10KW is relating to.

I'm merely stating facts that are based upon other experiences and proveable results. 10KW found what William Orr and others have discovered about coax, and active antennas. Baluns and Ununs have a place in RF, without their use, we'd have a lot more problems. Coax plays a dual-role in the everyday Radio Operator. Not only is it a conductor, but can also provide the means to stay on the air versus shut down or folded back because of SWR constraints.

Further down...

While Dancing with the Mouse on Fri, 12 Nov 1999 12:24:00 -0500, the
Modem interrupted with an MNI from "Bob <Bob@bob.com>", and the
MotherBoard buffered this to Video RAM:

:+> Hi Andy,
:+>
:+> Well, I won't dispute that most SWR meters are junk........
:+> but there is one thing that we need to stress here to the
:+> uneducated - I see a few posts down from some guy
:+> named "MC 10KW Jesus" spreading more misinformation.

I can't believe this...

I came out here to help people, and those same people throw out good
ideas because it doesn't "fit the mold".

To tell someone that SWR is *constant and never changes* is not the
answer to the question of "Why trimming coax changes SWR?".

The answer is simple...

The coax, by it's design, becomes an active part of the antenna system
when the center and shield currents present, are not allowed to meet
the antennas own impedance at the feedpoint connection. The coaxial
impedance and antenna impedance are not equal, energy is not being
absorbed by the antenna as a load, it becomes reactive and the coax
then reacts to this difference as it offers a complex series of
reactances based upon 50 ohms upon itself.

Unless the antenna is tuned, the impedance of the coax will not
terminate properly and deliver power to the load equally in both the
center and shield conductors.

Power is reflected back and is altered by any or all combination of
three different aspects;
One, by the antenna itself and it's reactive response as R+/-jX.
Two, the counterpoise that the antennas driven element works as R+/-jX
connection to the shield of an unbalanced cable.
Three, Due to the reactances above, the coax then cannot offer ideal
power delivery, so therefore offers is own independent R+/-jX.

These three factors, the first two, driven and the counterpoise
[ground] elements form the antennas R+/-jX.

Can be expressed as the antennas own impedance to the coax at the
feedpoint.

When coax and antenna do not meet at the same impedance, the coaxial
line will then act as a reactance to the radio.

A reflection occurs, or the Standing Wave formed along the coaxial
line is not a Conjugate match to either the Radio or Antenna. The coax
maintains it's impedance along the line with opposite reactive effects

at points along the line that offer Conjugate reactance to oppose the load that the coax is attempting to terminate into.

Unterminated coax offers reactive elements based upon it's impedance along it's length that are frequency dependent.

At these given points, unterminated, or the unbalanced character of coax, offers Inductive or Capacitive reactances, R-/+jX that can be used for conjugate matching of a load to the transmission line.

To arrive to a Conjugate match, the -jX and +jX operators the antenna *system* [this includes driven and counterpoise elements] presents to the frequency of interest, can be applied in series and parallel configurations, towards the unterminated coax.

The Coax, offering various levels of -jX and +jX at 50 ohms of both series and parallel impedance configurations, can offer a conjugate match at key regions along the length of the line to cancel out the antennas own operand [+/-jX] leaving only the resistive element of the coax and the antennas own resistive element providing a loss against the standing wave at this termination point.

Basically, the antenna becomes a tuning stub providing a +/-jX at that point along the length of coax, that can cancel out the +/-jX operator the coax has at the feedpoint for reflection of standing waves - allowing for this given length of coax to provide the radio or meter with a standing wave with the impedance of the coax being reflected to the radio.

What I'm saying here is, a bad SWR problem is when the antenna is not radiating efficiently and therefore provides a complex impedance to the coax. The coax then no longer terminates into a load, it reacts.

How it reacts is frequency dependent and due to its inherent impedance of 50 ohms with a wide variety of various Capacitive and Inductive reactances for this impedance, can provide the capacitive or inductive reactance to cancel out the antennas complex impedance but cannot solve for R - or the resistive element of the antenna itself.

With smaller [read shorter] antennas, this R value is small, so therefore a lot of power is wasted by the coax due to the tuning stub bleeding off energy it's attempting to absorb from the coaxs' termination point.

When the value for R in the antenna system is equal to the R impedance [R without -/+jX] of the expected impedance at the termination point, this point becomes a feedpoint to transfer power from the coax to the antenna system. We still do not have a conjugate match, for in order to leave R - both the coax and antenna system operands must cancel out to leave only R. Due to limitations of resistance of wires and mounting insulators and required hardware, the +/-jX operators will remain with smaller values but never abolute zero.

Since R for a 1/4 wave antenna is 36 ohms with a 90 degree perpendicular ground plane surface, some +jX is needed to raise the R value closer to 50 ohms thru the use of extra wire or inductance. The inherent capacitance of coax [-jX] due to spacing of the conductors, can provide the conjugate needed to meet R for both coax and the radios expected impedance load.

Now Quit! Geez!

Next question I have for you...

How do you determine SWR when the meters' own SWR readings vary along the length of coax? At the feedpoint? Just how do we obtain that when we use a mag mount that is sealed?

Go figure?

Regards!

Here ya go... When ya can't argue against something you start with the personal attacks. In this case you're calling into question my honesty. I have absolutely no reason to lie on this newsgroup.

That level is typical. The reason you think it isn't is because of the few you hear. I guarantee that for every amp user that is causing problems there are hundreds if not thousands that are not causing trouble. How does that saying go? It only takes one bad apple to ruin the barrell? I'd be extremely surprised if there was a single CB radio in my town that doesn't have at least a small 100 watt kicker. And of those that have more power, they rarely have the need to use more.

It's late night and quiet now (as far as static and such) and we're having a good time on channel 32 here. I just took a poll of the CBers on the channel. Out of 10 cbers talking on the channel now the highest power right now is 7 watts. I'm running the lowest at 2 watts. Now I've asked folks to crank up everything and tell me what it can do. The highest is 4kw, I'm a little lower than half way down the scale at 1.5kw, the lowest is 400 watts. Now we're all back to where we were before. Every CBer on this channel in this local area runs the lowest power they can to get clear comms. Last night, we were all running along about like we are now and this guy named Richard, who happens to be a ham by the way, came on the channel and started trying to wipe out our comms. He was swearing at us, calling us all kinds of disgusting names, talking bad about our lineage. We first attempted to reason with him, to no avail. The next thing we did was start upping the power until we once again had clear comms. If I can find out Richard's call sign I'll probably post it here and on all the ham NG's to make this jackass known to all. From what I've heard listening to my scanner he does the same crap on 2 meters. It's a wonder no one has already reported him for such behavior up there. Now that I think about it, that may be what has happened because I haven't heard him on the scanner in a while now. He can't get his agitation fix up there so he came down here to mess with us.

<<exactly our point. we don't have a whole lot of options and prefer not to choose your ham option so we invent our own.>>

Exactly my point (and I speak only for myself). You invent your own rules. You break existing rules as you see fit. If you deem it necessary to run 4KW, you would run 4KW. If you feel the urge to transmit on frequencies not allocated
to you, you just go ahead and transmit on those frequencies. By the example you set, It's no wonder many hams (and the FCC) see CBers as lawless, untrustworthy, and lacking any sense of accountability for their actions.

My opinion:

All this business about the ARRL and FCC being "out to get CBers" is a smokescreen for those who are looking for an excuse not to obey any rules.

No one can justify poaching on frequencies that belong to other people. And until the law is changed, they still *do* belong to other people. (See below)

You might check Deja.com about this subject. It gets hashed every couple days. The bottom line is this. The antenna is a vehicle/antenna thing. When you change frequencies your SWR will change. I have been installing and tuning antenna's for 4 years. I have done every antenna imaginable. I have not seen any antenna that will stay at a 1:1 SWR consistantly when you change the bands. Its a rare occurance to get it to happen on the regular 40. Put a Magnetic made and mounted antenna on the top of the truck. Tune in the frequency spectrum you want to use and be happy. Otherwise get an antenna matcher, keep a digital swr meter in line and tune your swr to a 1:1 match on the channel you are using.

Good luck.

You wouldn't believe the info i have!...LOL
I was unaware the going to college violates "Biblical Christianity" .
I spent a year at a nice little Lutheran college in Allentown,PA in 80-81
and they NEVER tried to push religion one anyone!
Muhlenburg was nice but Columbia was the best! 3 years of beer, women and
mainframes ! ! ! ! !

Andy,
As usual, your post was well thought out and accurate as well. Missing from your post was the one small thing most people overlook when checking the SWR on an antenna and that is this....The SWR should be read AS CLOSE TO THE ANTENNA AS POSSIBLE! ! !
As this is not always easily done most people will just stick a meter in line where they see fit to put one and this is where the allowances for coax have to come into play.

Has anyone out there heard of a Dak IV (6) mobile 40 channel ssb\am radio? I can't even find a Sams Photofacts reference for this model on the Sams site. This radio seems to be a mystery. I've asked on the ng before if anyone has seen or familiar with this model with no luck.

I've even searched ebay past auctions and there has never been one for sale there either.

Hello everybody,

Who can help me????? I often listen to ssb/usb stations on the 27 mhz For example frequency 27.555
I know every country has his own call sign. (for example: The Netherlands call-sign starts with: 19.

My question to you is: Who can help me by mailing me the complete list of country's and their numbers.

If you have such a list you can mail it to: rwm.music@worldonline.nl

Many, many thanks from Ricardo
The Netherlands

You ask me to leave you alone.

You send email to my email address, but don't have the common courtesy to reply.

You still talk shit, like you know what you are doing.... But, your ignorance shows with every post you make.

> Toll free you make fun of me because I havent ran bigger then a 16 pil

No, I post what is the truth. You are telling us that you know what will work with a higher power setup, but then admittedly later, you come and say that you have never run anything that large.

How do you KNOW it will work, when you have never done it, and how are you going to argue with people who have "been their, done that" when you haven't done it?

Are
> you saying your first set up was bigger?

4CX10K on the base.

That was my first real setup, being driven by a Johnson Viking Valiant II

In case you didnt realize That was
> my first Amp Set Up.

So?

This 2 drivin 8 driven 32 Pill is my second set up and
> from most people I talk to that is pretty impressive.

Just because you can quote what someone else is running, doesn't make you a big strap.

Like I said... I have yet to hear you or your station, but yet I talk to the big boys in your area on nearly a daily basis. Ask them...

My mext one will most
> likely be a single 3cx15000.

So, your going to go from a 3 K, to a 6K to a 35K?

And not know how any of it works!

Sounds like DaveMade found another idiot that they can keep selling to!

When they say "Stop cryin', and start buyin'", it is only a figure of speech.

>
> Didnt you say you run texas star? Come on what a joke.

A joke in what way?

I get more out of my Texas Star 8 pill than I have seen out of most any
other box (Competition or not).

Compared it to a Dave... I get more with less drive
Compared it to a Cookie .I get more with less drive
Compared it to a Pirate ...I get more with less drive.

Just because it says Dave, Cookie, Pirate, Pac Man, Cocaine, etc. on the
front doesn't make it the best amp on the market.

My 8 pill does a thousand Bird watts with 35 watts of drive.

Your's won't! And that is with 15.5 to 16 volts on the collectors.

So, who is the joke now? The guy who bought a name, or the guy that can
actually build something that works better than the other guy?

hi my friend. i invite you to see our holland web site at
http://home.wxs.nl/~19ir01 we would love to have you as a member. the HQ has a
good team there. you can see the 11 meter prefix list here
http://home.t-online.de/home/IRDX.GERMANY/prefix~1.htm hope this helps.

73 tim 2-IR-082 http://www.irdx.org

on the antenna should be a screw on where the whip stick down to the base load. unscrew it and pull it down in the base load, if the swr's are still not down, saw alittle off the whip to get the antenna to go down farther in the base load. GOOD LUCK

Buckaroo "223''

2121. Still avaiable!!!!!!!!!!!!!!!!!!!

ok andy check this out. a lot of guys run these suburbans. ok why is it necessary to put a ground strap on every moving part of this vehicle if these parts already have metal attached to them, to wit, the doors, the engine compartment hood, etc. it would seem to me that the fact that these parts of the car are attached, if you will, then rf will find this an adequate ground , but evidentally it doesn't , so i leave it to the distinguished professor of hook ups, ...sir you have the floor,......icm out....
Handy Andy wrote in message <382cf541.10969269@news.iserv.net>...

Toll, is your amp biased.? This would probably be the reason you are using
less drive.
My 8 pill will do 1150-1250 at 15 volts going forward on a bird. I have no
problem with driving it with more watts as long as I get more watts. I run
200 rms into it never tried a 5 pill like some .

That is the smaller of the 15Kw tubes.

The B series tubes are only good for what their plate dissipation is, as they do not have the current handling capabilities.

If anyone has dreams of competing against a 3CX15KA series tube with that one, dream on.

The 3CX15KB7 would have a hard time holding it's own with a 4CX5000R tube.

And, that is a little high in price. You can pick them up at a break for 750 or so, with a guarantee, and sometimes NIB.

Either or.

Dave's designs are nothing but Class C Motorola test fixtures with
"improvements".

> changed, as well as coming with a proprietary bias circuit in them?

Toll, I have seen some of the latest x force dc comp amps last weekend at a small keydown havent seen any change in the input, daves have been long acclaimed to have one of the best if not the best input in the business what could have been changed and what did it improve? Other than possibly a cap value changes. Are you saying the competition amps now have bias? Maybe some negative bias is in order. How can adding a bias circuit make it proprietary?
I have dave amps with negative bias supply, ab-1 for my ssb 3 pill,

> That would mean that all amplifiers are DaveMades...

>
> Who really gives a $hit anymore, anyways?
==========
Personally I don't since danny isnt with x force any longer from what i heard. He is with sludgehammer building the Bulldog amps. i guess they are going to be the next best thing since sliced bread.

THIS IS GOING TO BE THE PLACE WHERE I POST ALL TOLL FREES PERSONAL EMAILS IT SEEMS HE MUST SOMTHING TO HIDE:

STARTS HERE:

TOLL IM TELLING YOU

>>>Yes, that is your problem... You like to tell people everything, rather than ask.

IF i RUN A 16 PILL WITH AN M400, I CAN RUN A 32 PILL WITH AN M800.

>>>O.K. Whatever you want to run.

>>>Just doesn't make sense to me to run something that will underdrive your stuff.

>>>You should always strive to run 1 into 4 when it comes to 2879s.

>>>That has been proven to be the best, especially if you are going to run high volts on the pumphouse, and lower or 14 volts on the drivers.

>>>But, don't take my word for it, try it for yourself.

>>>When you don't see the numbers that some of the other guys see, you'l be back at Dennis' house to pick up yet another box!

IM ALSO SAYING IF I CAN RUN A 16 PILL WITH A SINGLE 250A I CAN RUN A 32 PILL WITH THE 250A ALTS.

>>>Whatever floats your boat.

>>>Can you get 6Kw out of your single 250A alternator setup?

>>>If not, then you don't have enough alternator.

>>>Dave's boxes will do it. I have seen it.

THIS SEEMS TO GROOVE WITH CONCRETE MAN

>>>Good. Dennis is telling you what you want to know.... Or is that want to hear?

BUT IT COULD BE POSSIBLE THAT HE IS JUST TRYING TO MAKE THE SALE.

>>>That could be, too. Whatever floats your boat!

HE SEEMS TO BE YOUR IDOL SO WHY NOT ASK HIM?

>>>I have already spoken to Dennis about it once.

>>>BTW, he is far from my idol. He is just another box builder, in a long line.

>>>However, you where the one that originally brought him into this, stating that you where only less than an hour away. That is why I stated anything that had to do with him.

>>>He is someone that can vouch for my credibility when it comes to building and working on this shit we call CB... You wanted someone nearby... How about your builder.

> Toll, is your amp biased.?

>>>No. I use a more efficient input network than "the other guys".

>>>However, you are right. A non-biased amp needs more drive to get the same power output as a biased amp, however, the total saturated power is usually higher from the Class C, non-biased amplifier.

This would probably be the reason you are using
> less drive.

>>>No. I use a more efficient input network than "the other guys".

> My 8 pill will do 1150-1250 at 15 volts going forward on a bird.

Probably tops out at close to 1500 (15-1700?)? That would be my guess.

I have no
> problem with driving it with more watts as long as I get more watts.

>>>That is somewhat of a catch 22, as some of the input power will be fed through to the collector, and out the matching network.

>>>This is the same thing the tubes do... People think when they piledrive a box with mo watts, they are seeing more out... Some of that is feedthrough.

>>>To test for this, you need a meter at the input and output of your box. Measure the increase in output while you increase the input.

>>>You will find a point when you increase the input 100 more watts, the output only increases 90 or so watts.

>>>The other 10 watts is being used to heat up your pills in the big box.

I run
> 200 rms into it never tried a 5 pill like some .

That is a respectable level.

I run a Texas Star 350 into mine (Class C as well, but uses a Texas Star board, and so forth) when I really want to play. 30 watt carrier, swinging up to 150 or so. This will give me nearly 1600 watts Bird, swinging from 1Kw.

The setup I use low drive (read that as around town and general skip talking) keys 300 watts and swings a thousand.

I like forward bump.

I dont give a flying fuck what you say and im sure you feel the same way.

>>>Actually, if I didn't care what you said, I wouldn't respond to you.
Their are plenty of people that I ignore on that group.

HEY TOLL IM GLAD YOU CARE?<?<PROZAC SAID THAT

>>>You spread disinformation because you don't know what you are talking
about. I correct you. That pisses you off and you get emotional about it.

WHERE IS THE DISINFORMATIOS?<?<PROZAC SAID THAT

>>>Get over it. You don't know everything. Neither do I. I know that I
have been building linears for quite some time, have the respect of most
every box builder on the keydown circuit, both for AC and DC skills, and
that you are a relatively unknown.

>>>What does that tell you?

OH NOW YOU ARE COMMING OUT OF THE CLOSET?<?<PROZAC SAID THAT
I ADMITTED THAT ON THE NEWS GROUP?<?<PROZAC SAID THAT

What you have against me I dont know but Like I said I dont give a flying
fuck. I have no reason to lie about anything or make up stories or what ever
you think I do.

>>>I don't think that you purposefully lie, make up stories or anything
else.

THEN WHY SAY IT?<?<PROZAC SAID THAT

>>>I think that you really don't know what you are talking about, because
you have little experience in what you are talking about!

I already told you that I dont know every thing there is to know, I have
gone though a shit load of schooling but the way I look at school is as a
place to learn how to learn.

>>>That is what grade school and middle school are for.

>>>High school is for you to lay the mathematical foundations for the
college level classes you have to take to become someone.

>>>If you are only learning how to learn by the time you are taking ordinary
differential equations, then you are about 15 years behind the competition!

It doent matter what you learn it is that fact that you have the ability to
lean that the emloyer of today is looking for.

>>>Not my employer! If I told him that I didn't know what I was doing, but I was willing to learn, he would have never hired me.

>>>I make 100+ thousand dollars a year. I usually don't do a damn thing, either.

WHY DONT I BELIEVE THIS?<unk>?<unk>PROZAC SAID THAT

>>>But, when the shit hits the fan, and MCI has taken an entire office down, and that office loses a quarter of a million dollars or more a day, my boss can send me to Chicago and knows that by the next morning I will have a workaround in place unless MCI gets their shit together and fixes it!

And you know what That is exactly what I have to offer.

>>>Great! Shut your mouth, listen and learn. If you don't agree with something someone posts, I suggest you get a small amplifier, a voltmeter and ammeter and a variable power supply and test it for yourself.

>>>I have done it, and I know what it will do. So have all the other people on the newsgroup that told you that you where wrong.

>>>If you wouldn't have spouted off with all your ranting about how smart you are, what your education level is / was, told us that we didn't know what we where talking about and made an ass out of yourself, you would have earned the respect of the people on it, and they would have taught you things.

>>>At this point, you have a long, uphill climb ahead of you to make people think that you are not just a normal asshole. Sorry, but that is the truth.

YOu know what else an employer looks for? Degree's

>>>No shit.

>>>Guess I am O.K. their.

>>>BSEE, ASM (I double majored in Mathematics and Electrical Engineering), both given by UCSD.

>>>Also, MCSE, CNE / CNA / CNX, A+ and CCNE.

>>>So, I guess I have the diplomas, as well as the certifications to go along with them, huh?

WHY DONT I BELIVE THAT EITHER?<unk>?<unk>PROZAC SAID THAT

do they care that you
played around with Multi Meters and read current in your car?

>>>Yes. It shows carefulness and attention to details. I know that I can tell you exactly what is going on in my station at all times. Without that, your half lost.

They dont care how much current is running through your radio shack meter

>>>Radio Shack? Now you are showing your ignorance again. Sorry, all digital meters are made by Fluke, Tektronix makes my scopes, HP my counters and all analog meters and meter movements are Simpson.

in for can sit down do some calculas and prove your theory on paper.

>>>If need be, I can do it all on paper, as well as BEEN THEIR, DONE THAT in the real world.

Have a nice day... I do mean that.

They may be, but his building of plasma genrators, broadcast amplifiers etc must have had some help he was the one who implemented the changes. Perhaps if you ask ice he will tell you some stories of how some things got designed /built many years ago. he started modifying tx stars, tnt's hes not much on reading books. so you could actually say tx star had a big hand in his experimenting days. Im Out reading the mail.

well i think the bayshore network is got it going on over on the east side new jersey way, no doubt about it, just needs some refinement and a goal of what you want to do and you can do it, i think it is a start and at least someone is trying , so my hat is off to the young blood, so don't worry about some of these old codgers trying to piss in your cornflakes, do what you want to do when it comes to cb stuff, and if you don't feel like going to these 'breaks' as they are called, i got a secret for ya, you ain't missin much. i will say this much . if i went, i wouldn't tell my girlfriend, because if she found out i was into this cb nonsense she would drop me like a bad habit...anyway, i am a secret admirer of the bayshore network,.....icm out

Good guess but depending on the slug I get a legit 1800/1900 on a 2500 slug
and over 2kw on a 10 kw slug.

> >>>That is somewhat of a catch 22, as some of the input power will be fed

I agree again, this happens when sum use a 5 pill to drive a 8 pill or
2/2290's driving a 2 pill.

I agree also the point of diminishing return, 100 watts more drive and no amplified return only 100 watts more comig out

Actually, it's funny that you call yourself ICM.
One of the biggest statiosn outside the "bowl" gamers in the local mixed up world of Ancint Mary C.B.er's up/down/way over here is "ICM 2000" and is good friend with the good doctor that makes the house warmers.
When I first joined on and saw the name, I figured you might be him.
Oh yeah.. the good doctor that built the 20kw is rumoured to be working on a 50kw that he is naming "Spike." He calls his 10kw-er's "Clam Bakers." If I ever meet him I plan to ask him why.

2156. Re: DELTA FORCE CB's

Newsgroup: rec.radio.cb
Date: 1999-11-13 00:00:00 UTC
From: CodysPC@Iserve.Net
Message-ID: <382dad7f.9098439@news.iserv.net>
Source record: 10532

Greetings!

[Hi Dave, good to know you're curious about this radio...]

... Ahhh, but wait, theres' more! ...

Delta Force, a big radio, with a lot of buttons. Fun to play with, but can be dangerously distracting on the road when attempting to use the controls. You gotta' have it right in front of you at times to see the function buttons and set it up right.

It's not a simple radio, but can work like a Grant or Cobra 148 once set. Getting it set or re-set when accidentally bumped, makes this radio dangerous to use in a moving vehicle!

Vertical mounting of the front face, and the sheer weight of parts on the main PCB does create a problem or two with vibration. Had one listener comment about SSB warble, due to the radios weight boucing on the bracket - there seems to be the need for some small revisions to some areas of the board to increase mass for connections.

The "warble" was due to voltage across some junction being affected by vibration, not by regulation. Tapping the main PCB, this shows up. Another fault of "First off the line model".

Speaking of which, I thought this was kinda neat, the board uses a larger regulator that can deliver power to the echo-talkback boards as well as supply the current demands rather well without tremendous amounts of heat. The regulator circuit is simple, doesn't have short circuit protection, but does offer plenty of amperage to supply the board with power.

This would make an excellent base radio, but not an easy one to use in a moving vehicle.

Once you've set the display and tuning controls to what you want, the radio works just like any other CB radio, only a lot louder. Receiver performance is important. If you suffer from engine noise from a previous radio, this is not a miracle cure. But, once above the noise level, the received signals are wonderfully clear and crisp sounding.

The RF gain section needs more work, and AGC with ANL and NB - I found the radio noisier with these functions turned on in some cases than with them off and riding the RF gain control instead.

PCB board gets my vote on being better than Midland or other thinner boards and thickness of copper. Offers better and more solid connections. But this adds weight too. Some spacers on the bottom -

foil side- of the board to help dampen vibration may help.

If they [new owners] drive, this radio is a bit complex. Once set, I found the front controls layout pretty good, although the dual gang controls at the clarifier and talkback/echo can be hard to work with when you have fat fingers.

As a benefit, there is a confirmation beep thru the speaker for some functions. To discern the different types, a long or short beep is heard. Not a bad idea, but once again, in a noisy environment you may never hear these tone beeps for keys pressed, and while you're standing still these beeps are annoying as h*ll in volume. Having to hold down a button till it beeps is another annoyance.

A simple radio, like the PC-122 is a lot less complicated for those that drive a lot and use the radio everytime in their vehicle. No confusing dual-gang controls and easy to "find home" versus on the MDF.

The dual gang controls are another one of my beef. The clarifier and talkback on on the same ganged control. Doesn't help with SSB users - touch one, the other control will also operate. Mine has a small "eccentric", read bent shaft, which affected the clarifier then you adjusted the talkback and vice-versa.

Changing bands were also another, as well as using modes and some of the "SHIFT" and "Function" buttons. Hard to remember programming and even harder to choose while driving. A rotary knob is far better to use in driving situations versus a small button, while you're bouncing along. You have to glance at the display all the time to verify where you're at and the mode your on.

Hey, Dave I appreciate you asking the question, I'm just being honest with you. This just isn't a radio for those that can be too easily disracted while driving - too complex to use all it's functions, all while hurling youself down the road. I don't have the time to waste on trying to make a radio like this work when I've got other things to do while on the road. A simpler function radio does the same job and sounds about the same. Although if it's possible, the audio from the MDF would do wonders for any other CB radio.

But when you have time to play, this radio is good for that.

Another neat thing that could be expanded on, is the lighting control.

It has a brushed aluminum faceplate decal on a clear plastic back. If they would only thicken the plastic a little more and offer less aluminum just under or around the knobs, to allow the clear plastic back to work like a fiber optic, the radio will have outstanding nightime illumination which would help a lot of drivers for nightime use. The LCD panel is quite bright at night, even with the dim feature on, and the model I have allows some of the light to pass thru into the front panel knobs so you could at least locate the Echo and

Clarifier/Talkback pots if you look just right.

And er, no - not quite the same board. It's just components used in the areas like the final driver sections, and the audio amp sections as well as RX portions of the board, are similar - but layout is different. I'm saying that the operation of these areas, when trouble aises, are to be thought of as those along the 88-99 series for troubleshooting. The component lables are good, but don't follow the Galaxy due to revisions in the numbering of parts. So, what my be D39 on the Galaxy, might be D144 on the MDF.

Greetings!

Sounds like a bad switch with the first one - it happens. The other mic, you hear a squeal, so that tells me the Mic is not wired correctly.

There is a difference in models of the 510.

There is the 510e - 5pin - I believe this uses a Condensor mike type and the 510XL - 4 pin - uses Dynamic element.

Make sure you get the right mike and cord for it.

I beleive the 510e will mate up with a Cobra 19+ [grey key] mic. They both use condesor elements and they get power from the radio in the mike socket.

Unless, since you've got it from a friend and it's a used radio - they may have modified the wiring to accomodate the mike from another radio.

Hope this helps.

They are about the same distance wise. However, because most radio wave interference is ampitude in origin, FM is alot quieter, and at the extreme limits of range, this quieter signal can be the difference between understanding or being understood, or not.

Can you get 6Kw out of your single 250A alternator setup?

>>>If not, then you don't have enough alternator.

>>>Dave's boxes will do it. I have seen it.

I dont know where these guys come up with this stuff- Ohms power law does not lie. Power = Volts X Amps. Even if the alternator is doing 18 volts @ 250 amps it is still only is making 4500 watts so how are we doing 6KW. And thats input power- not even output power. No amp is 100% efficient. Id like to meet this guy Dave becasue if he can get more power out of an amp than the power supply is actually dissapating he just found a way to solve the energy crisis! He should be running his own electric company instead of making CB amps! Much more profitable.

Jim

Dearest Bill

I know I said I wasn't going to respond - but the little guy on my left shoulder with the horns and the pitch-fork keeps encouraging me.....

> Sorry, son. Regardless of whether you answer or not, you are wrong.
> To act as an impedance transformer - the coax would have to be either
> higher or lower in impedance than 50 ohms (depending on whether the
> antenna impedance was higher or lower than 50 ohms.
>

I'm not in disagreement with this at all. I think you are saying the same thing as I am but just a little differently.

>
> Now the impedance that the transmitter sees will vary with coax length,
> but that does not mean that the impedance is being transformed. The
> mismatch at the antenna will remain the same - no matter what you do
> to the 50 ohm coax length.
>

I won't disagree with this either. But insofar as the impedance that the transmitter sees will vary with the length of the coax, it is, in essence, a transformation.

> So you are turning your coax into an antenna, then trimming it for
> resonance. Big deal - that has nothing to do with impedance transformation.
>

Not exactly. You see, when you have an electrical half-wave of coax, it will reflect the load at the other end. In my example, the load will be infinity (or close to it) because the coax is unterminated. Don't forget there is a 50 Ohm dummy load in parallel at the T connector. If you take your parallel resistance formula, Rt=1/(1/R1+1/R2) Apply this to our experiment 1/(1/50+1/inf) [1 over infinity is always 0. If you don't believe me, sub in 99999999etc.or study the exciting life & times of Newton, that's Isaac, not fig] You get 50 Ohms. There is nothing inherently antenna'ish about the coax itself. It is not resonant and all the power is being dissipated in the 50 Ohm load.

2176. Re: Busted Power Supply

Newsgroup: rec.radio.cb

Source record: 10561

You've done broken it. The most common failure of cheap linear power supplies is the output transistors. Yours must be cheap too 'cuz it didn't have any current foldback or crowbar protection circuitry. But before I would go wasting money on new transistors, I would pull them off the heat sink one by one and check for shorting. This is easy with a digital meter. Use a Fluke meter 'cuz all others are made in foreign sweatshops. Flukes are made in good all American sweat shops. Flick your Fluke meter to diode check and probe all three contacts on the transistor each way. That's 6 measurements altogether. 2 of these measurements will read 0.6 on your real' American meter. The other four measurements will read nothing. If you measure anything other than that, the device is damaged and must be replaced. Each output transistor has a porcelain power resistor soldered to the emitter. If any of the transistors were blown, see above, replace all of these porcelain resistors - preferably with the same value and power rating, just in case that wasn't obvious. Some guys don't do this part. These guys end up fixing their power supply many times. Sometimes they realize that the same output transistor keeps blowing, sometimes they don't. Some guys know about current-hogging, some guys don't. Back to our scheduled dissertation....If it wasn't the output transistors it could be one of the transistors driving them. You can test these in the same manner but it'll probably be more difficult 'cuz you'll have to desolder them from the circuit instead of just unscrewing.

If you have ruled out any transistors, it's time to start looking at the regulator. This is almost certainly a MC1723 or equivalent. These are notorious for blowing the input junction inside the chip. Given they cost less than a dollar each, just buy a new one and replace it. Oh yeah, it would be a good idea to get a chip socket so it will be easier to replace next time - and there will be a next time.

If you replace it and it still doesn't regulate......the problem is elsewhere and that is where power supplies start getting unique. Hope this helps. Unplug the unit before you start messing with it otherwise the experience could be shocking.

i don't doubt the truth of this story as i've heard some un-true and out right false dealings with the florida dept of children and families that were so outragous as to border on nightmarish.
usually there is at least something, even if it is totally false, that started the investigation. there is nothing in the article that says why the state started the investigation in the first place.
i can't draw any conclusions either way on this situation as i don't know the parents or the states cause of action. it would be interesting to know.
my prayers go with the party that God knows is right.
the parents, if they are right.
the children if the state's right.
and God help the one's that are wrong because, either way, the children are the only victims regardless of who's right.

the fine points of beams arn't exactly my strong suit but here's something to think about.
when you built it, did you use an SO-239 coax connector or connect the coax directly to the radiator elements?
in which ever case, are your coax connections tight enough and secure when you move it from the veritical to the horizontal?
if not, your problem may lie there.
also, when you go to the vertical, does the grounded radiator parallel the mast or does the hot, (center conductor), one?
if the hot one does and you adjusted the SWR under these circumstances, when you move the hot leg away from the mast, you've just changed the reflective properties of the whole antenna system.
take it for what it's worth and good luck.

it never ceases to amaze me that the ham community ALWAYS make an analogy
between people who choose to interpret the FCC rules their own way and total
the breakdown of society as a whole as though we were going to cause armagedon
to come early but when there is an overly broad statement about the ham
community being lumped together as a bunch of holier than thou ass holes, they
come out of the wood work and try to distance themselves from each other
saying,
"i never said that" or "we all don't agree with that opinion".
where are these not-of -the-same-opinion people when we are called to task for
bringing a plague upon the earth?
i probably won't get an answer to this question like i couldn't get an answer
to the question i asked 100 times a month ago.
jeff

Besides some Clarion and Midland walkies and a Sears Base Station mine was a ten tube Aircastle JE321(which was actually a Courier),that my uncle gave to me in 1972 when I was 15,along with a 9' whip. Both of which I still use today. The whip is mounted on my barn's metal roof. Shelled out $20 for a license in my dad's name, KGZ-8688. Got a Lafayette HB 940 in 1975,and a 3 element beam,later a Navaho 458,a Browning MIV, a ham ticket, a KW 930s,and a bunch of other radios off and on. I still have everything listed above and use it quite often.

well put. i wonder how much of the ham community would rally behind the head of
the FCC if he were replaced by an avid, non-ham cb'er.
i'd bet the entire ham spectrum would fall silent as they would all be in
washington lobbying to have the "bum" thrown out.
when the shoe is on the other foot, it just doesn't seem to fit quite the same.

TOLL FREE PLEASE LET ME KNOW WHERE I SAID I KNOW EVERYTHING ABOUT AMPS? ID LIKE TO READ IT.

I THINK IT IS GREAT YOU DO ALL THAT WITH YOUR FAMILY. I MEAN THE DIRT BIKES AND VACATIONS. But I think CB is a little toy that I play with it isn't a family event for me. You must be a lucky person if you have all this time on your hands. I Have to work 40 hours a week after doing the same at school.

You told me in your Email that you make well over 100,000 a year? Well if you do make that much money and have all that time left to play and still sit here and fight with a total stranger you are really fucking lucky.

Maybe that is what your problem is you take this shit to seriously.
I don't know what you are trying to accomplish by saying I don't know everything because I said it many times already.

How long are going to act like children and keep going in circles? PS how old are you? Not that it really makes a difference but I'd like to think that When I get old I will have better things to do with my life. I just turned 22 and I feel like a retard fighting like this. IM your mind you may think you made me look small and maybe you idols that think you know your shit think you made me look small but you Mean nothing to me.

i think your beanie is too tight.
when you have a ham in charge of enforcement, it's like having a sheriff in a town where most of the residents are hanging from his family tree, or in this case his beam.
outsiders beware! don't piss off any family members or you won't stand a chance.
there are some of us who do believe in the constitution and won't allow our rights to be walked over like the door mat and the supposed automatic right to inspections at the first key of a microphone.

>
>What makes the band unusable IS THE CBers running more than 4 watts.

what makes a car unusable on the interstate is when it runs on 2 cylinders.
back in the 50's when the band was comparatively quiet, 4 watts wasn't too much of a struggle.
when the band started to get populated, the FCC opened up a whopping 17 more channels in 1978. i agree that the people who use linears can be a problem but the bigger problem lies in the proliferation of cheap cb radio's that anyone can afford.
when the were more complicated and expensive, they were an object for the "upper class" who could afford them. now, they're so cheap, you can pick up one for under $30.00.
it is all of this "air pollution" that causes more problems than all of the amps in use today. this is why people feel the need for 100 watts to just get across the street in some areas. a good analogy to this is light pollution that astronomers suffer when a telescope is built on a dark mountain and 40 years later a bustling city is wrapped around that mountain rendering the telescope usless. you either build a bigger, more powerful telescope or you shut it down.
if the recruting efforts by the arrl and the ham community in general were wildly sucessful and everyone operated WITH A TICKET AND WITHIN THE RULES, you would have the same pile-ups across the spectrum that we have daily in our small 450 khz corner today. you would be tripping over fellow hams all of the time like we do cb'ers but you wouldn't be able to complain because everyone would have their ticket.

>4
>watts is not only enough for what the band was intended for but also
>enough for the ilegal worldwide DXing.

and so was the 23 original channels, IN IT'S DAY. there is a need for change just like there was in 1978.

>Besides the limit is 12 watts on
>SSB and an SSB signal is more efficient anyway.
>

this is true but i think you'll find that if the price of ssb radios were to come down to where am cb's are today, you'll find as much or more congestion on ssb as there is on am today.

Normal would be about 14.2V. But you'd never see this because we already know the output is way too high. The feedback voltage would also be correspondingly high and, consequently, the drive to the bases of the output transistors would be, well, low.

> If the base voltage is high,
> the problem is in the driver transistor or the regulator IC. Measure

I disagree. The output transistor(s) could be melted through and the supply rail could in fact be pulling the base up. Seen this before.

> Unless you have a voltage chart for the
> regulator, the easiest thing to do is to substitute a known good
> regulator IC. Most manufacturers provide a socket for the regulator

At the risk of sounding like a hypocrite, I wouldn't attack the unit exactly how I was trying to tell the owner too. This is because I know power supplies like I know women. Well, maybe I know power supplies a little better. I was giving the owner some simple trouble-shooting techniques worthy of trying out before he mule-kicked it across the room. As boring as they may sound, power supplies are an excellent starting point for learning about electronics. They incorporate many concepts that are incredibly useful such as voltage reference, high-gain amplifiers, voltage dividers, current sense, current sources, negative feedback techniques, current amplification, transformers, transient suppression, filtering, bandwidth limiting and power disipation techniques - and that's just linear supplies. Switchers teach you about pulse width modulation techniques, RF suppression and drive requirements at much higher frequecies which is a great starting point for understanding RF circuitry. I got my start in electronics with power supplies and have used the techniques in products that I've designed for myself and the compnay I work for. These include products in the digital, analog, power and RF domains.

>have run linears huh?

get off the pot, boy.
you know that the FCC regs. say that hams can use as much power as nesessary,
up to your license limits, to carry on a usable communication and you can't
tell me that a large number of hams don't use it to get over high
concentrations of atmospheric noise. this is what ham is all about unless
you're doing qrp work.

>But I seriously doubt there was any
>activity by unlicensed foreign stations if it was an international
>ham band.

haven't you gotten off the pot yet?
there were / are many countries out there that haven't signed the itu treaties.
"out-band" operations are really nothing new and in those countries,
technically don't exist. there, anything goes.
if you ain't been there, you shouldn't assume anything.

>Secondly, you have an unrealistic view of how hams operate.
>You seem to think that the first thing a ham does in the face of
>interference or tough conditions is to kick on a linear and "run power".

again, this is what hams are allowed to do up to your license limits unless
you're running qrp. we don't have this needed luxury.

>As if power solves everything. Truth is, most hams don't even own an
>amplifier and get by with a barefoot 100 watt transceiver.

then what's your beef?????

>I find your POV truly disturbing. You are saying that people in South America
>
>have no right to their CB radios. But you, an American, do. As if your
>communications is more important - because it's in English.

i find your, (hams), POV disturbing because you act like you have a God given
right to bitch about what we do when you have all of that unused spectrum out
there wasting away and you want to crowd into a little 450 khz space and act
like you own the place.
the people in the latin speaking countries either have no controls on them or
they aren't enforced. we have to put up with all of there crap but you come
here and only bitch at us, not them. even if we do run legal, it ruins our
comms too.
there was a cb'er the other day who asked a question about how to use a linear.
the word linear poked some ham-with-a-badge in the eye and he didn't look any
farther before he started throwing threats at him about the FCC.
the REALLY, REALLY STUPID part of all this was that if the ham had looked at
the guy's e-mail address, he would have seen that the guy was in the U.K. where
the FCC has no reach.
you hams-with-a-badge are so narrow-minded that we need a 1 hz filter or we
loose your message in all the noise that you make.

>Not a good justification for adding more noise and interference
>to the band and taking away other users right to it.
>

another piece of mis-leading information.
you guys get on here and act like we position people all over the country with
amps just to jam the band.
each station is independantly owned and operated. there are some assholes out
there but, i assure you, it is NOT a concerted effort to take away everyones
rights to ust the band.
if ham is so great why are you here?
yes, you have the right to be here but it's begining to sound like you have no
interest in cb other than to use it as a reason to bitch.

>Paranoid fantasy. The actual facts of how 11 meters came
>into existence (and how many hams were its first users) have been
>posted here a million times. I suggest you look it up.

The same way in which guns are on thier way to being banned. They
weren't paying attention. There were probably groups of hams
(probably those that used 11 meters) who tried to raise a red flag,
just like groups such as the NRA are raising a red flag about guns.
But nobody listened. And the band was lost.
>

If you guys don't care much about the 11 meter band then why the heck are you on this NG day after day after day preaching about what we do here?
>
> Either way, your argument is wrong. You should try to listen to your
> arguments a little better before posting. They simply don't make sense.

Typical, just like the anti-gun crowd, you anti-amp-on-cb folks can't argue your point with logical thought. All you can do is claim that the logical thoughts of those on the opposing side don't make sense.
>
> By the way, why do you keep repeating that the 11-meter band was one

> and always has been, the most popular DX band (followed closely by
> 75/80). I doubt the 11-meter band was even in the top ten.

I keep saying that because that's what I've been told by some old-timer hams who were actually there using 11 meters back in the day. The ones I knew who were around back then have unfortunately gone silent key since then so even if I knew thier call sign so you could look it up and get their contact info from the FCC (Which is another thing I dislike about hams and is why I changed my mind and decided not to get my ticket. The less the gov't know about me the better. The fewer gov't databases my name shows up in the better. Especially ones that are open to the public.) it wouldn't do ya any good

Mostly because the level of apathy in this country as to what we let the gov't and it's various agencies get away with was very low. Now it's very high. Most people have never even read the Constitution or even understand what it means. I saw a poll once in which people were asked to describe what was in the 1st Amendment. A full 30 % said that it guaranteed freedom from pain. Now days most of the Bill of Rights is ignored by our gov't whenever it suits it's purposes. Look at all the property seizures that happen. I read once about a 60 year old grandmother who had children in Louisana and in Texas. She spent most of her time driving back and forth between the children in her motor home. The DEA noticed how much she drove up and down that route and pulled her over, confiscated her motor home and she didn't get it back until nearly three years later after she had spent almost enough $$$ on lawyers to buy a new one at which time the gov't simply gave it back to her without it ever going to court. By the way, they never found any evidence of drugs. The Constitution protects us from that type of BS, yet the gov't ignores that part because it's inconvenient. The Constitution says that congress must approve ALL taxes placed upon the people by the federal gov't. Yet the FCC taxes us at will without such congressional approval.

I have a Galaxy DX55V that is connected to a K40 3" fiberglass whip with 18' RG-58 coax. On D band channel 1 my SWR's are 1.2 while on channel 40 they are a little above 2. I've tried a 4' whip and also tried a different antenna but my SWR's remain about the same. I'd like to lower my SWR's on the upper channels. Any advice would be greatly appreciated. The rig is installed in my '96 Ford Ranger. I previously had a similar set-up with a Radio Shack CB (I don't remember the model #) and my SWR's were almost non-readable.

The ultimate measure of a man is not where he stands in moments of comfort and convenience, but where he stands at times of challenge and controversy.

yeh , i would suggest a good tower and rotor setup, this is a healthy antenna with switchable polarity, i have one new in stored in my garage. i tried to put it up on a poor man's tower but it didn't work out too good so i took it down and put it in storage, but things change don't you know, so maybe i will take it out and try again, except this time with a rohn tower or some reasonable facsimile thereof. i am impressed about the quality of jo gunn antennas. it would take a lot of abuse to damage these things. they are stout and you can get different gamma matches for whatever power you are thinking about using. i think stock they come with 2000 watt capabilities, not sure on that though, take care and enjoy,.....icm out

well it isn't going to do 250 amps at 18 volts, these things i think are rated at that amperage only for the usual 12-13.5 volts area and i always shy away from wild outrageous power claims , i don't think dave has ever made any wild claims , it is just these excited and excitable kids that are doing that sort of thing,...icm out......

2221. FS. Realistic TRC-458 with echo board and Cobra 139XLR

Newsgroup: rec.radio.cb
Date: 1999-11-13 00:00:00 UTC
From: preacherky@aol.com
Message-ID: <19991113163039.07828.00000841@ng-bg1.aol.com>
Source record: 10606

Hi.

I have a Realistic TRC-458 that i have personally used and it has varable key mod done and extra channels with a connex board installed and ready to go...infact when i took it to my cb shop for the yearly tune up i was told that the connex board that is in that radio was the biggest one that he had ever seen. i would rate this one a 8 out of 10.

I also have a Cobra 139XLR with upper and lower channels with the varable key (varable wattage) mod done i would rate this one a 7 out of 10

you make offers.
Please e-mail my friend about this stuff he is the one that wanted me to advertise this stuff. you can e-mail him at b3dude@hotmail.com

I am wanting info on how to tune my own radio. I have a Cobra 29 LTD classic. Not a high dollar guy but don't see any point in paying some guy 50 bucks to do the work when his cost is $1. Am very inclined just don't know where to get the schematics and info that is not too far over my head. thanks.

not to mention if that r/c plane took a nose dive into someones face.
back 35 years ago, my brother hand built an r/c plane on 27 mhz from balsa,
paper and dope from scratch. he put a lot of work into it.
at the time, the rochester ny police used a freq somewhere near 30 mhz.

he was in the park flying his plane when a nearby cop keyed up and his air plane became a sea plane right into the lake.
needless to say, he was mildly upset.

Source record: 10634

if all involved would freely agree to this, it would be great.
to try to enforce this would be to form a second elite radio group that would only serve to divide the cb'ers cause against the holy ham position.
the other problem with this, at least in the U.S., it the fact that the only reserved or dedicated channel on cb is channel 9. ssb activity above ch 35 is, by tradition, only and is in no way binding.

>> If you here amers from 27.355mhz through 27.955mhz explain firmly about
>> the
>> agreement and use of these frequencies

it appears that the only people in agreement on this are the sidebanders.
i also enjoy ssb but i also enjoy am dx work on the "quieter" channels.
if a sidebander were to come on and try to "firmly" tell me to go ssb or get off the frequency, what i would have to say to him would make his antenna look like a burned out match when i was through with him.

>This is the only way we as
>> sidebanders
>> will have an enjoyable band to communicate on sitting back and allowing
>> it to
>> happen will only mess up the
>upper portion of 11 meters for all of us.
>> 73's and good dxing to all.

as a sidebander, i would like to agree with you. but as one who also enjoys am dx,
i would have to ask you the same question that i've asked the hams for 2 months and that is:
who are you to dictate what cb'ers do on the cb band?
none of us own the band nor can we control it's use as this is the relm of the FCC and the FCC only.
the hams don't control the cb bands and, by the same token, neither do the sidebanders.
this is not directed to you as much as the original author who ever he may be.
you asked for opinions and this one is mine.
have a good day.

2250. Antenna question for RV

Newsgroup: rec.radio.cb
Date: 1999-11-13 00:00:00 UTC
From: davesg@freenet.tlh.fl.us
Message-ID: <davesg-1311991823300001@192.168.0.2>
Source record: 10635

It's come time to drop a CB into my RV. I've just ordered a Midland 77-115. Looks like a decent radio, nice high-tech look. Now I need to decide how to set up the antenna. I've read the FAQ but still have a few specific questions. I remember reading a while back that Wilson antennas are a good brand, so I figured I'd go with them. It will be mounted in a '95 GMC conversion camper van with a fiberglass roof. I'd like to bolt the antenna either to one of the front side view mirrors, to the roof rack or the ladder on the rear door. Are any of these positions suitable to give decent reception? The bumper would be fine also. I'm sure I'll have more beginner questions once everything gets hooked up.

Thanks,
David

one thing to be aware of is the fact that, since the 50's, the world picture has changed dramatically.
there are countries that don't exist anymore and, also, there are hundreds of new countries that have cropped up that didn't exist back then either.
a lot of the countries that signed the ITU treaties have "changed hands" and don't subscribe to those restrictions anymore and a lot of the new ones haven't signed those treaties either.
it's akin to the U.S. states each declairing independence from the United States and becomming an individual country unto it's self.
some may abide by the treaty and others may not as, in this case, the original United States government would no longer exist.
how many countries sprouted from the original soviet union or the larger african nations and how many do and don't abide by the treaties?
their political structure is in such a shambles that i would think the ITU would be below the bottom of their list of priorities.
if one were to check into this, i think one would find that by shear numbers, the ITU treaties have pretty much fallen apart mearly by the nature of the world politictical structure today.
members have withdrawn either by attrition, evaporation or by placing important priorities first that really benefit their populations.
just my opinion.

Jeff,
Strangly enough, the "Central Governments" of those so called Banana
Republics do care about 3rd party ITU agreements because they are a
amjor source of revenue. The International Telephone Companies pay the
local telephone company for the use of the telephone lines in their
respective countries for calls originating outside their borders. ITU
is a mjor supporter of somal 3rd world countries and that revenue is
jealously guarded since the local post & telecommunication ministry
usually runs the telephone service. Money talks, BS walks. BTW, most
of these countries really frown upon any 2 way radio comms outside Ham
and then you are not allowed any 3rd party traffic inorder to protect
the revenue source. CBs are unknown in some parts of Africa and
possession of an unregistered radio transmitter is serious business.

Breathe....breathe!
Handy Andy <CodysPC@Iserve.Net> wrote in message news:382dad7f.9098439@news.iserv.net...
Greetings!

[Hi Dave, good to know you're curious about this radio...]

... Ahhh, but wait, theres' more! ...

Delta Force, a big radio, with a lot of buttons. Fun to play with, but can be dangerously distracting on the road when attempting to use the controls. You gotta' have it right in front of you at times to see the function buttons and set it up right.

It's not a simple radio, but can work like a Grant or Cobra 148 once set. Getting it set or re-set when accidentally bumped, makes this radio dangerous to use in a moving vehicle!

Vertical mounting of the front face, and the sheer weight of parts on the main PCB does create a problem or two with vibration. Had one listener comment about SSB warble, due to the radios weight boucing on the bracket - there seems to be the need for some small revisions to some areas of the board to increase mass for connections.

The "warble" was due to voltage across some junction being affected by vibration, not by regulation. Tapping the main PCB, this shows up. Another fault of "First off the line model".

Speaking of which, I thought this was kinda neat, the board uses a larger regulator that can deliver power to the echo-talkback boards as well as supply the current demands rather well without tremendous amounts of heat. The regulator circuit is simple, doesn't have short circuit protection, but does offer plenty of amperage to supply the board with power.

This would make an excellent base radio, but not an easy one to use in a moving vehicle.

Once you've set the display and tuning controls to what you want, the radio works just like any other CB radio, only a lot louder. Receiver performance is important. If you suffer from engine noise from a previous radio, this is not a miracle cure. But, once above the noise level, the received signals are wonderfully clear and crisp sounding.

The RF gain section needs more work, and AGC with ANL and NB - I found the radio noisier with these functions turned on in some cases than with them off and riding the RF gain control instead.

PCB board gets my vote on being better than Midland or other thinner boards and thickness of copper. Offers better and more solid connections. But this adds weight too. Some spacers on the bottom - foil side- of the board to help dampen vibration may help.

If they [new owners] drive, this radio is a bit complex. Once set, I found the front controls layout pretty good, although the dual gang controls at the clarifier and talkback/echo can be hard to work with when you have fat fingers.

As a benefit, there is a confirmation beep thru the speaker for some functions. To discern the different types, a long or short beep is heard. Not a bad idea, but once again, in a noisy environment you may never hear these tone beeps for keys pressed, and while you're standing still these beeps are annoying as h*ll in volume. Having to hold down a button till it beeps is another annoyance.

A simple radio, like the PC-122 is a lot less complicated for those that drive a lot and use the radio everytime in their vehicle. No confusing dual-gang controls and easy to "find home" versus on the MDF.

The dual gang controls are another one of my beef. The clarifier and talkback on on the same ganged control. Doesn't help with SSB users - touch one, the other control will also operate. Mine has a small "eccentric", read bent shaft, which affected the clarifier then you adjusted the talkback and vice-versa.

Changing bands were also another, as well as using modes and some of the "SHIFT" and "Function" buttons. Hard to remember programming and even harder to choose while driving. A rotary knob is far better to use in driving situations versus a small button, while you're bouncing along. You have to glance at the display all the time to verify where you're at and the mode your on.

Hey, Dave I appreciate you asking the question, I'm just being honest with you. This just isn't a radio for those that can be too easily disracted while driving - too complex to use all it's functions, all while hurling youself down the road. I don't have the time to waste on trying to make a radio like this work when I've got other things to do while on the road. A simpler function radio does the same job and sounds about the same. Although if it's possible, the audio from the MDF would do wonders for any other CB radio.

But when you have time to play, this radio is good for that.

Another neat thing that could be expanded on, is the lighting control.

It has a brushed aluminum faceplate decal on a clear plastic back. If they would only thicken the plastic a little more and offer less aluminum just under or around the knobs, to allow the clear plastic back to work like a fiber optic, the radio will have outstanding nightime illumination which would help a lot of drivers for nightime use. The LCD panel is quite bright at night, even with the dim feature

on, and the model I have allows some of the light to pass thru into
the front panel knobs so you could at least locate the Echo and
Clarifier/Talkback pots if you look just right.

And er, no - not quite the same board. It's just components used in
the areas like the final driver sections, and the audio amp sections
as well as RX portions of the board, are similar - but layout is
different. I'm saying that the operation of these areas, when trouble
aises, are to be thought of as those along the 88-99 series for
troubleshooting. The component lables are good, but don't follow the
Galaxy due to revisions in the numbering of parts. So, what my be D39
on the Galaxy, might be D144 on the MDF.

You also have to look at the power the batteries can instantaneously
supply..

Approximately 1100 amps per battery, for near 10 seconds.

And proportionally longer, when you don't ask them to supply as much.

Simple thinking skills should let you know that.

Toll Free

Because of the following reasons:

1. Some of them are attached via rubber grommets to keep squeaks down.
2. Some of them are painted before they are attached, because of primering and such. The RF connection needs a low impedance to travel across, and something that shows zero ohms DC resistance may not be good for RF....
Case in point, a piece of 24 guage wire.

But, you should know this already, right Pinhead?

Don't worry Cliffhanger, most hams started out as CBers but very few hams sent their licenses back to the FCC and said let me go back to CB. But I keep my CB in my truck and RV alnog with base station to speak to my friends on CB. Never forget your roots and be willing to help all, be radio-active.

Jeff, in the AMATEUR BANDS ONLY, the OO program only functions as an
Auxiliary to the FCC, the OO may accompany or work with the FCC. The
OO usually gathers evidence for the FCC. The OO is, however, respected
as an Expert Witness in a proceeding due to his "Ham" licensure and some
weight (Legal term-means judge usually believes him or her).

The same Federal Law that created the Amateur Auxiliary also also allows
for a CB FCC Auxiliary if an Organization could be found to sponsor
it.

The RF police can only call the FCC (the legal right of any free citizen
of the US), the FCC usually only watches, they are slow moving like a
snake but when they strike, they know how to hit. They love to gather
evidence as to keep everything airtight. And Secret, they don't revel
much due to the Federal Secrecy Law.

I don't trust ANYTHING the gov't says. These are the same people who make attempts to ban guns when all of the data shows that the stricter your gun control laws are the worse the violent crime rate is. These are the same people who refuse to ban products that have been the direct cause of many thousands of doccumented deaths but ban things like red M&M's because cancer showed up in some lab rat when it was force fed enough of that dye to cause it's fur to turn red. It was years before M&M Mars was able to find a different red dye that matched the orriginal color and passed the gov't approval. These are the same people who waste billions of dollars on a so-called war on drugs that has gone on for years with no noticable effect on the amount of drug use. In fact, drug use has increased instead of decreased.

And I'm supposed to believe what these folks say? Especially when it's supporting some law they've passed without my having a chance to vote on it? It'll be a frosty day in the under-regions before that happens.

O.K., let me make this simple for you...

I posted this once, but I guess that you can't read, or can't comprehend.

Please try this time.

You also have to look at the power the batteries can instantaneously supply..

Approximately 1100 amps per battery, for near 10 seconds.

And proportionally longer, when you don't ask them to supply as much.

Simple thinking skills should let you know that.

Toll Free

From what I've seen so far they also advocate changes that just might eliminate the need to run amplifiers. I saw a poll on thier web site that was designed to help decide the order in which they want to make changes. One of the changes was increasing the power limit. I don't know where in the poll results that fell as far as order of importance, It obviously wasn't first as the first was apparently removing the 250km limit. The fact that they were even willing to consider it as an option means they're open to the idea.

wow, that really made sense... NOT!!!

The Constitution says that the FCC coming into my home without a warrant is illegal.

FCC rules are way different from state laws. In the majority of states, a new state law is put before the voting public. If the people of Alabama were given an opportunity to vote on the subject of CB rules and they voted to make amps illegal it'd be a totally different matter. I, as a citizen of Alabama, would be perfectly willing to abide by those rules. The federal gov't on the other hand has absolutely no business making any laws or rules or anything else that effects an individual American citizen. The federal gov't was created for the purpose of arbitrating disputes between the states, providing a military defense, and anything else that is beyond the ability of state gov't. There is no law the federal gov't can pass effecting an individual citizen that isn't easily within the ability of the state gov't where that individual lives. If California want's to legalize the medical use of marijuana it's absolutely none of the federal government's business. If Louisiana wants to keep the legal drinking age at 18, it's none of the fed's business. Yet in both of these cases the fed's overstepped thier Constitutional bounds by sticking thier nose into the internal affairs of those two states. Louisiana was forced by the federal gov't to raise the drinking age to 21. California legalized the medical use of marijuana, then the federal gov't said that they'd prosecute any doctor writing prescriptions for it.

>resource (the RF spectrum).
>
a natural resource??? what tree do you pick your ocillators off from?
trees, petrolium, metals etc are a natural resource.
radio transmissions, (RF spectrum), for reasons of this disscussion, are purely
manufactured and synthetic and do not occur in nature.

sifting through all of the " why's and where for's", on the surface, the FCC and it's regulations are legal and have a noble mission.
looking under the carpet, there is one piece of dirt that ruins the whole carpet.
the constitution guarantees that no one can come into my home and search or sieze my property without just cause as determined buy a dualy appointed judge and have a warrant issued by said judge.
then, if anything is taken, there is a right of due process that protects me from government abuse and this is called right of appeal. in the mean time i am innocent untill proven guilty.

ON THE OTHER HAND,

if the FCC thinks that i have broken a rule, by keying the microphone, they have written in the rules an assumed waiver of my rights to the above protections and think they can walk into my home without a warrant and rifle my radio shack.
if i refuse to let them in, they walk away and, in a few days, i get a letter from happy hollingsworth with a $4000.00 ticket to the FCC ball. NO probable cause and NO evidence to back up their suspicicions which i must pay unless i go to their office and convince them of my innocince.
if i get a speeding ticket, i can choose to pay it and plead guilty or i can go to court and not say a word and force the county to prove their case against me without helping their case at all unlike letting the FCC in and giving them the evidence against me which flies in the face of my rights against self incrimination.
the FCC "rules" were written in exact opposite of these constitutional protections.
here in florida, when you sign your drivers license application, you are also agreeing to take a blood alcohol test when asked by a law officer. this too has a noble cause as it can help deter drunk driving. i am 15 years sober and in no way condone drunk driving but if you look under the carpet, you'll find that if you refuse this intrusion into your body, (some localities require a blood test), you automatically loose your license for 6 months and your insurance company raises your rates as though you were convicted of dui.
there are some religions that ban alcohol use and also ban blood letting or transfusions.
what if some poor shmuck of one of these religious persuations works a double shift and is tired while driving home. he crosses into the next lane and is pulled over. granted, he shouldn't have been driving under these circumstances but he is NOT drunk, refuses a blood test and at most is guilty of careless driving, (a $54.00 ticket).
now he looses his license for 6 months and his insurance rates jump high enough to make an antenna enthusiast jealous.
all because he was exercizing his RIGHT to practice his religion by not letting the state violate his body.
same applys to my exercizing my RIGHT not to let the federal government violate my home un-waranted.

what worries me is that more and more branches of the government will bypass the constitution by instituting "rules" instead of "laws". big brother will become more and more intrusive as time goes on and, eventually, the constitution will become as effective as the ITU treaties, ie; nill.
don't call me paranoid as it happend with the FCC "rules and has happened here in florida. how many other federal, state and local laws follow this pattern and how many more are to follow?
think about it.
jeff

the thing i get a kick out of with the RF police is all of the FCC threats that
they make.
in one breath, they threaten to turn over to the FCC all the e-mail addresses
of people who post on the subject of mods or amps like they have some personal
control over enforcement and in the next, they say they have absolutly no pull
with the FCC so they don't look like a bunch of brown nosers.
the one that really made me LOL was the poor guy that asked a question about an
amp and some ham scorched him with threats of the wrath of the FCC.

the only hitch was that the guy's e-mail address clearly showed that he lived in the U.K..i think the ham thought that the FCC was a division of interpol or his mind was so narrow and single-minded that he thought his RF badge had jurisdiction in England.
i actually enjoy assholes like these because it exposes the RF police for the bunch of shit heads that they really are.

who created it is not as important as what course it has taken in the last 65 years.
we have the best form of government in the world but, as with anything else, it's not perfect.
with the changing of the guard every 4 to 6 years, things can get pulled and distorted over that length of time into something that is unrecognizable as compared to what it looked like or what it's stated goals were at the time of it's inception.

Thanks for setting me straight, Jeff! I think I finally unerstand:

You have $20 in your wallet.
You're not using it right now.
I will just take it.
The Constitution says nothing about this being illegal.
And the state laws are silly and unfair anyway.
The elected officials who wrote them are probably corrupt.
They discriminate against people who need $20.
After all, I need that $20 more than you do.
Lots of people take money every day and don't get caught.
And who's never broken a rule or two?
Police have more important crimes to deal with anyway.
You have $20 in your wallet.
You're not using it right now.
Therefore I will just take it.

>The DEA noticed how much she drove up and down that route and pulled her
>over,
>confiscated her motor home and she didn't get it back until nearly three
>years
>later after she had spent almost enough $$$ on lawyers to buy a new one

in pinellas county fla, a man was arrested on suspicion of drug possession.
his new vette was confiscated. the charges were dropped and it took him a year
to get his car back.
when he got it back, the sheriffs dept had racked up 19,000 miles on the car
with the excuse that they didn't want the drive train to lock up so they let
the deputies take it home at night.
i drive 34 miles a day round trip to work every day and don't rack up 19,000
miles.
he sued for the dept for devaluation of the car.
this is the problem with the FCC. they don't write "LAWS", they write "RULES".
they don't have "FINES", they have "CIVIL FOREFEITURES" which DON"T require the
same level of proof that a guilty verdict in a criminal court requires and
doesn't always have the benefit of appeal.
it's a word game that they play that circumvents your civil rights.
regardless of wether O.J. was innocent or guilty, he was found innocent of
murder in a criminal court but was found liable in a civil court for nicoles
death.
show me the logic in this???
if the criminal court says he had nothing to to with the deaths, why does he
owe $33,000,000.00 to the familys?
this is the same thing with the FCC.
they know that the triangulation coordanances, the key signature and voice
print technology would be weak in a criminal court so the take it into the
civil court arena where the preponderance of the evidence rules arn't so
strict.
all they have to show is that they have a good idea that you're guilty and
you've been had.
if it were taken into criminal court under it's rules, they'd all be wearing
clown hats.
this is the scarry part.
jeff

>
> Breaking the law is breaking the law, Jeff. You're trying to claim
>that your law violation are less than another law violation, but it is
>still a violation of the law.

for one thing, i am NOT breaking any "LAWS".
the ONLY law that congress has made regarding the RF spectrum was 65 years ago in forming the FCC.
everything since has been "RULES" written by the FCC.
so what your saying is that if i deserve a public flogging for my activities, you do too for excedeing the speed limit on the highways or if you J-walk or flip a piece of trash on the ground? after all, your law violation is no less than my rule violation.

> One major aspect of Amateur Radio is the
>self-policing of our own frequencies.

key word here is policing "OUR" frequencies.
cb policing is out of the hams domain and in the domain of the FCC ONLY.
even then, in your frequencies, you have no "police" authorities in the ham bands.
you can use direction finding equipment and ASSIST the FCC but you, yourselves have NO right to tell anyone anything. contrary to popular belief, you did NOT receve a badge with your ticket.

>The FCC has repeatedly said that
>they expect that.

of the hams on the ham freqs. not cb.
>If you didn't go around bragging about your illegal activities in this
>newsgroup, we would not even know you were there, Jeff. We know you are
>there because you told us - right here in this newsgroup.

and, by the same token, the hams have no right to complain when they get their hair scorched when they come here with their DF antennas on their heads like halos and presume that they have the power of God to tell anyone what to do.
we don't go to rec.amateur and troll for arguements there, do we? the funny thing is, i've been there and helped hams with ILLEGAL mars / cap mods and admitted publically that i was an out-bander.
i have never met with so much as one post condemning me for what i do.
most comments are either neutral or live and let live. it's a whole different,(higher), class of ham there unlike here.

> And, once you make statements in this newsgroup, other CB'ers have a
>right to comment on those statements. That includes the CB'ers who also
>hold a ham license.

>
this is true. if you want to comment for or against my activities and debate the issues, i welcome this with open arms.
it's when you come here and act like we're some kind of trash, just because we don't wipe our collective asses with a ticket, this is when i start shooting the RF mounted police right out of their saddles at the first sound of a gallop.

with every point you have brought up here, you have lost so many feathers that none of them fly.
does this mean that you have plucked yourself?
jeff

>You're the one going around claiming that hams have no business
>posting to this newsgroup. If we did say that you couldn't post to the
>ham newsgroups, we would only be applying your own standards there.

>>I was simply stating that you, as a CB'er without a ham
>license, would have little reason to post anything in the ham radio
>newsgroups.

i was corrected on this on this 3 months ago and have modified my stance since.
i HAVE posted to rec.amateur and HAVE helped hams with different problems
including mars and cap mods and mobile electrical noise problems and have
receved thank you's for them.
just because i don't wipe my ass with a ticket doesn't mean i don't have
something to contribute.
i just don't go trolling for trouble like you and the other RF police do here.

>Please stop trying to twist
>my words.

this is a trait that i've learned well in self defense from the RF police.

>If you want to read more into that then there is, then you
>have a very vivid imagination.

no, just past experence.
> However, I seriously doubt they were "ordering people around." You
>claimed that I was telling you what to do with my simple statement above
>- perhaps that is what they were doing and you just twisted their words also.

if you wern't here a couple of months ago, then you have no idea what you're
talking about.
it is you that is not reading something into this arguement something that was
here.
i suggest that, until you know exactly what you're talking about, you shouldn't
draw any conclusions about what went on here.
i'm not hasseling you, it just seemed that you fell right in line with the rest
of the RF police in the "company line" about peoples RF practices so in turn,
you got caught in the crossfire.
jeff

All I can say is I can vouch for Toll or Shane making that much money on his job since we both have the same profession. Only difference I am a SQL Server DBA and he is a Oracle DBA. Am I right Toll????
I am going out now to put the hammer down!!!!!!

Source record: 10703

God created the mule, and told him, "You will be mule, working constantly from dusk to dawn, carrying heavy loads on your back. You will eat grass and lack intelligence. You will live for 50 years."

The mule answered, "To live like this for 50 years is too much. Please, give me no more than 20." And it was so.

Then God created the dog, and told him, "You will hold vigilance over the dwellings of Man, to whom you will be his greatest companion. You will eat his table scraps and live for 25 years."

And the dog responded, "Lord, to live 25 years as a dog like that is too much. Please, no more than 10 years." And it was so.

God then created the monkey, and told him, "You are monkey. You shall swing from tree to tree, acting like an idiot. You will be funny, and you shall live for 20 years." And the monkey responded, "Lord, to live 20 years as the clown of the world is too much. Please, Lord, give me no more than 10 years." And it was so.

Finally, God created Man and told him, "You are Man, the only rational being that walks the earth. You will use your intelligence to have mastery over the creatures of the world. You will dominate the earth and live for 20 years."

And the man responded, "Lord, to be Man for only 20 years is too little. Please, Lord, give me the 20 years the mule refused, the 15 years the dog refused, and the 10 years the monkey rejected." And it was so.

And so God made Man to live 20 years as a man, then marry and live 20 years like a mule working and carrying heavy loads on his back. Then, he is to have children and live 15 years as a dog, guarding his house and eating the leftovers after they empty the pantry; then, in his old age, to live 10 years as a monkey, acting like an idiot to amuse his grandchildren. And it is so.

ICE, ICE, AND MORE ICE MR. ICECOLD BIG APPLE TREES JUST GOT DOWN.....

Shit is a powerful word. Just think of all the concepts
and ideas you can communicate with it. Shit may just be
the most powerful word in the English language.

CONSIDER THIS:

You can be shit faced, be shit out of luck, or have shit for brains.

With a little effort you can get your shit together, find a
place for your shit or decide to shit or get off the pot.

You can smoke shit, buy shit, sell shit, lose shit, find
shit, forget shit, and tell others to eat shit and die.

You can shit or go blind, have a shit fit or just shit your life away.

People can be shit headed, shit brained, shit blinded, and shit over.

Some people know their shit while others can't tell the
difference between shit and shineola.

There are lucky shits, dumb shits, crazy shits, and sweet shits.

There is bull shit, and horse shit.

You can throw shit, sling shit, catch shit, or duck when
the shit hits the fan.

You can take a shit, give a shit, or serve shit on a shingle.

You can find yourself in deep shit, or be happier than a
pig in shit.

Some days are colder than shit, some days are hotter than
shit, and some days are just plain shitty.

Some music sounds like shit, things can look like shit, and
there are times when you feel like shit.

You can have too much shit, not enough shit, the right
shit, the wrong shit or a lot of weird shit.

You can carry shit, have a mountain of shit, or find
yourself up shit creek without a paddle.

Sometimes you really need this shit and sometimes you don't
want any shit at all.

Sometimes everything you touch turns to shit and other
times you swim in a lake of shit and come out smelling like

a rose.

Shit! When you stop to consider all the facts, it's the
basic building block of creation.

And remember, once you know your shit, you don't need to
know anything else.

Many people are at a loss for a response when someone says "you don't
know Jack Schitt". Now, you will be able to handle the situation...

Jack is the only son of Awe Schitt and O. Schitt. Awe Schitt, the
fertilizer magnate, married O. Schitt, the lawyer with Knee, Deep, &
Schitt law firm.

In turn, Jack Schitt married Noe Schitt and the couple produced 6
children: Holie Schitt, Fulla Schitt, Giva Schitt, Bowl Schitt, and the
twins, Deep Schitt and Dip Schitt (a high school drop-out).

After being married for 15 years, Jack and Noe divorced. Noe later
married Joe Sherlock. Because her kids were still living with her, she wanted
to keep her previous name. She was known as Noe Schitt-Sherlock.

Dip Schitt married Loda Schitt and they produced a cowardly son, Chic
Ken Schitt. Fulla Schitt and Giva Schitt were inseparable throughout
childhood and consequntly, married the Happens brothers in a dual ceremony.

The Schitt-Happens children were Dawg, Byrd, and Hoss. Bowl Schitt, the
prodigal son, left home to tour the world. He recently returned with
his new Italian bride, Pisa Schitt.

Now, when someone says you don't know Jack Schitt, you can correct them.

The Compleat SHIT List

THE GHOST SHIT
The kind where you feel shit come out, see the shit on the toilet paper,
but there's no shit in the bowl.

THE CLEAN SHIT
The kind where you feel shit come out, see the shit in the bowl,
but there's no shit on the toilet paper.

THE WET SHIT
You wipe your ass fifty times and it still feels unwiped. So you end up
putting toilet paper between your ass and your underwear so you don't
ruin them with those dreadful skid marks.

THE SECOND WAVE SHIT
This shit happens when you've finished, your pants are up to your knees,
and you suddenly realize you have to shit some more.

THE BRAIN HEMORRAHAGE THROUGH YOUR NOSE SHIT
Also known as "Pop a Vein in your Forehead Shit".
You have to strain so much to get it out that you turn purple and

practically have a stroke.

THE CORN SHIT
No explanation necessary.

THE LINCOLN LOG SHIT
The kind of shit that's so enormous you're afraid to flush it down
without first breaking it up into little pieces with the toilet brush.

THE NOTORIUS DRINKER SHIT
The kind of shit you have the morning after a long night of drinking.
It's most noticeable trait is the skid mark left on the bottom of the
toilet bowl after you flush.

THE "GEE, I REALLY WISH I COULD SHIT" SHIT-
The kind where you want to shit, but even after straining your guts out,
all you can do is sit on the toilet, cramped and farting.

THE WET CHEEKS SHIT
Also known as the "Power Dump". That's the kind that comes out of your ass
so fast
that your butt cheeks get splashed with the toilet water.

THE LIQUID SHIT
That's the kind where yellowish-brown liquid shoots out of your butt,
splashes all over the side of the toilet bowl and, at the same time,
chronically burns your tender poop-chute.

THE CROWD PLEASER
This shit is so intriguing in size and/or appearance that you have to
show it to someone before flushing.

THE CRACK FLAPPER SHIT
This shit seems to create its own weather system. Your butt cheeks
feel like they're flapping in the wind when this shit comes out.

THE MOOD ENHANCER
This shit occurs after a lengthy period of constipation, thereby
allowing you to be your old self again.

THE "ON THE CLOCK" SHIT
This is any shit that you take while you are punched in at work.
Lunch hour and coffee break shits do not qualify.

THE "BEST NICKEL I EVER SPENT" SHIT
This is any shit that you take in a "pay" bathroom. Thankfully,
there aren't too many of these left. If you're ever in a Mexican border
town, be sure to try one!

THE RITUAL
This shit occurs at the same time each day and is accomplished with
the aid of a newspaper.

THE GUINESS BOOK OF RECORDS SHIT
A shit so noteworthy it should be recorded for future generations.

THE AFTERSHOCK SHIT
This shit has an odor so powerful than anyone entering the vicinity within the next 7 hours is affected.

THE "HONEYMOON'S OVER" SHIT
This is any shit created in the presence of another person.

THE GROANER
A shit so huge it cannot exit without vocal assistance.

THE FLOATER
Characterized by its floatability, this shit has been known to resurface after many flushings.

THE RANGER
A shit which refuses to let go. It is usually necessary to engage in a rocking or bouncing motion, but quite often the only solution is to push it away with a small piece of toilet paper.

THE PHANTOM SHIT
This appears in the toilet mysteriously and no one will admit to putting it there.

THE PEEK-A-BOO SHIT
Now you see it, now you don't. This shit is playing games with you. Requires patience and muscle control.

THE BOMBSHELL
A shit that comes as a complete surprise at a time that is either inappropriate to shit (ie. during lovemaking or a root canal) or you are nowhere near shitting facilities.

THE SNAKE CHARMER
A long skinny shit which has managed to coil itself into a frightening position - usually harmless.

THE OLYMPIC SHIT
This shit occurs exactly one hour prior to the start of any competitive event in which you are entered and bears a close resemblance to the Drinker's Shit.

THE BACK-TO-NATURE SHIT
This shit may be of any variety but is always deposited either in the woods or while hiding behind the passenger side of your car.

THE PEBBLES-FROM-HEAVEN SHIT
An adorable collection of small turds in a cluster, often a gift from God when you actually CAN'T shit.

PREMEDITATED SHIT
Laxative induced. Doesn't count.

SHITZOPHERENIA
Fear of shitting - can be fatal!

ENERGIZER vs DURACELL SHIT
Also known as a "Still Going" shit.

THE ROCKET SHIT
The kind that comes out so fast, you barely get your pants down when you're done.

THE LIQUID PLUMBER SHIT
This kind of shit is so big it plugs up the toilet and it overflows all over the floor. (You should have followed the advice from the Lincoln Log Shit.)

THE SPINAL TAP SHIT
The kind of shit that hurts so much coming out, you'd swear it's got to be coming out sideways.

THE "I THINK I'M GIVING BIRTH THROUGH MY ASSHOLE" SHIT
Similar to the Lincoln Log and The Spinal Tap Shits. The shape and size of the turd resembles a tall boy beer can. Vacuous air space remains in the rectum for some time afterwards.

THE PORRIDGE SHIT
The type that comes out like toothpaste, and just keeps on coming. You have two choices: (a) flush and keep going, or (b) risk it piling up to your butt while you sit there helpless.

THE "I'M GOING TO CHEW MY FOOD BETTER" SHIT
When the bag of Doritos you ate last night lacerates the insides of your rectum on the way out in the morning.

THE "I THINK I'M TURNING INTO A BUNNY" SHIT
When you drop lots of cute, little round ones that look like marbles and make tiny splashing sounds when they hit the water.

THE "WHAT THE HELL DIED IN HERE?" SHIT
Also sometimes referred to as The Toxic Dump. Of course you don't warn anyone of the
poisonous bathroom odour. Instead, you stand innocently near the door and enjoy the
show as they run out gaggin and gasping for air.

THE "I JUST KNOW THERE'S A TURD STILL DANGLING THERE" SHIT
Where you just sit there patiently and wait for the last cling-on to drop off because if you wipe now, it's going to smear all over the place.

FARTS DEFINED

THE ANTICIPATED FART: This one warns that it is back there waiting for some time before it arrives. A person who is uneasy for a time in a crowd and who later farts at a time when they think no one will notice has farted an Anticipated Fart.

THE BACK SEAT FART: This is a fart that occurs only in automobiles. It is identified chiefly by odor. The Back Seat Fart can usually be concealed by traffic noise as it is an eased-out fart and not very loud. But its odor is foul, will give it away, due to the way air moves around in a car. And then someone
will say, who farted in the back seat?

THE BARN OWL FART: A familiarity with owl calls is helpful in identifying this fart. Almost any morning if you get up just before daybreak you can hear one of these birds talking to himself. It's a sort of a crazy laugh, particularly
the way it ends. If you hear a fart that has about eight notes in it, ending on a
couple of down notes, and it sounds maniacal, you have heard the rare Barn Owl Fart.

THE BULLET FART: Its single and most pronounced diagnostic characteristic is its sound. It sounds like a rifle shot. The farter can be said to have snapped it off. It can startle spectators and farter alike. Fairly common following
the eating of the more common fart foods, such as beans.

THE COMMAND FART: This fart differs from the Anticipated Fart in that it can be held for long periods of time waiting for the right moment. Unlike the Anticipated Fart, it is intended to be noticed. Harold Tabor recently held a Command Fart for the whole period in history class and let it go right at the end when the teacher asked if there were any questions.

>THE COMMON FART: This fart needs little description. It is to the world of farts what the house sparrow is to the world of birds. I can see no point in describing this far any further.

THE CUSHIONED FART: A concealed fart, sometimes successful. The farter is usually on the fat side, sometimes a girl. They will squirm and push their butt way down into the cushions of a sofa or over-stuffed chair and ease-out a fart very carefully without moving then or for some time after. Some odor may escape, but usually not much. Common with some people.

THE DUD FART: The Dud Fart is not really a fart at all. It's a fart that fails. For this reason it is strictly a group one identification fart, because there
is no real way you can identify a fart that somebody else expected to fart but didn't. It is the most private of all farts. In most cases the farter usually feels a little disappointed.

THE ECHO FART: This is a fart that can be wrongly identified. It is not some great loud fart in an empty gym or on the rim of the Grand Canyon. The true Echo Fart is a fart that makes its own echo. It is a two-toned fart, the first tone loud, then a pause, and then the second tone. Like an echo.

THE G AND L FART: This is one of the most ordinary and pedestrian of farts, known to everyone. Certainly it is the least gross. If you have not already guessed, G and L stands for Gambled and Lost. One of the most embarrassing of all farts, even when you are alone.

THE GHOST FART: A doubtful fart in most cases, as it is supposed to be identified by odor alone and to occur, for instance, in an empty house. You enter and smell a fart, yet no one is there. People will insist that only a fart could have that odor, but some believe it is just something that happens to smell like a fart.

THE HIC-HACHOO-FART FART: This is strictly an old lady's fart. What happens is that the person manages to hic cough, sneeze, and fart all at the same time. After an old lady farts a Hic-Hachoo-Fart Fart she will usually pat her chest and say, "My, my", or "Well, well". There is no reason she should not be proud, as this is probably as neat an old person's fart as there is.

THE JERK FART: The Jerk Fart is a fart by a jerk who smirks, smiles, grins, and points to himself in case you missed it. It is usually a single-noted, off-key, fading away, sort of whistle fart, altogether pitiful, but the jerk will act as if he has just farted the Biggest Fart in the World Fart.

THE JOHN FART: The John Fart is simply any ordinary fart farted on the john. It is naturally a group one identification, with the wound, whatever it was, somewhat muffled. If it is all the person's trip to the john amounted to he will be disappointed for sure. Common as pigeons.

THE LEAD FART: The heaviest of all farts. It sounds like a dropped ripe watermelon. Or a falling body in some cases. It is the only fart that goes thud. Except for the odor, which is also very heavy, it could be missed altogether as a far. What was that, you might think? And never guess.

THE MALTED MILK BALL FART: Odor alone is diagnostic and positively identifies this fart. It smells exactly like malted milk balls. No other food works this way. It is rare.

THE OH MY GOD FART: This is the most awful and dreadful stinking of all farts -a fart that smells like a month-old rotten egg - as the Oh My God Fart. If you should ever encounter it, however, you may first want to say, oh shit, which would be understandable.

THE OMEN FART: This is the adult version of the Poo-Poo Fart. About the only difference is that the farter will not say anything. He will just look kind of funny and head for the john. This one is easy to spot if you pay attention.

THE ORGANIC FART: Sometimes called the Health Food Nut Fart. The person who farts an Organic Fart may be talking about the healthy food he eats even when he farts. If he is heavily into health foods he may even ask if you noticed how good and pure and health his fart smells. It may smell to you like any other fart, but there is no harm in agreeing with him. He is doing what he thinks is best.

THE QUIVER FART: A group one identification fart only. When you fart, it quivers. If it tickles, then it is the Tickle Fart. If you have to scratch it, then it is the Scratchass Fart.

THE RAMBLING PHADUKA FART: You must not be fooled by its pretty-sounding name, as this is one of the most frightening of all farts. It is frightening to farter and spectator alike. It has a sound of pain to it. What is most
diagnostic about it, however, is its length. It is the longest-lasting fart there is. It will sometimes leave the farter unable to speak. As though he has
had the wind knocked out of him. A strong, loud, wavering fart, it goes on for at least fifteen seconds.

THE RELIEF FART: Sound or odor don't matter on this one. What matters is the tremendous sense of relief that you have finally farted. Some people will even say, "Wow, what a relief". Very common.

THE RELUCTANT FART: This is probably one of the oldest farts known to man. The Reluctant Fart is a fart that seems to have a mind of its own. It gives the

impression that it likes staying where it is. It will come when it is ready, not
before. This can take half-a-day in some instances.

THE RUSTY GATE FART: The sound of this fart seems almost impossible for a fart. Is is the most dry and squeaky sound a fart can make. The Rusty Gate Fart sounds as if it would have worked a lot easier if it had been oiled. It sounds like a fart that hurts.

THE S.B.D. FART: S.B.D. stands for Silent But Deadly. This is no doubt one of the most common farts that exists. No problem of identification with this one.

THE SANDPAPER FART: This one scratches. Otherwise it may not amount to much. You should remember that if you reach back and scratch, it automatically becomes a Scratchass Fart. Common.

THE SKILLSAW FART: A truly awesome fart. It vibrates the farter. Really shakes him up. People back away. It sounds like an electric skillsaw ripping through a piece of half-inch plywood. Very impressive. Not too common.

THE SONIC BOOM FART: The people who believe in this fart claim it is even bigger than the Biggest Fart In The World Fart. The Sonic Boom Fart is supposed to shake the house and rattle the windows. This is ridiculous. No fart in the world shakes houses and rattles windows. A fart that could do that would put the farter into orbit or blow his crazy head off.

THE SPLATTER FART: Unfortunately the Splatter Fart exists. It is the wettest of all farts. It probably should not be called a fart at all.

Not totally true.

RF is a limited resourse, and mother nature has provided it to us.

Their was RF long before their was a receiver to hear it on.

Just listed to one of the radio telescopes.

We aren't making those signals.

> sifting through all of the " why's and where for's", on the surface, the

judge
> and have a warrant issued by said judge.

That is only to protect your rights.

Since the FCC has been created to "rule" (for lack of better terms) over the
RF specturm, your "right" to operate a radio transmitter becomes a
priveledge.

The constitution says nothing, nor does it serve to protect, priveledges.
Only rights. You don't have the right to operate a transmitter.

> then, if anything is taken, there is a right of due process that protects
me
> from government abuse and this is called right of appeal. in the mean time
i am
> innocent untill proven guilty.

And you are. That is why they don't throw you in prison when they find a
Palomar 225 on the bench when you are "invaded".

>
> ON THE OTHER HAND,

>
> if the FCC thinks that i have broken a rule, by keying the microphone,
they
> have written in the rules an assumed waiver of my rights to the above
> protections and think they can walk into my home without a warrant and
rifle my
> radio shack.

No, you have let their "assumed waiver" clause stick by putting an antenna on your roof and broadcasting.

Or, even wording it closer, you have agreed to that rule by a binding contract that took place when you put your station up.

Simple. Don't want to be invaded by the FCC, don't buy a transmitter.

> if i refuse to let them in, they walk away and, in a few days, i get a
letter
> from happy hollingsworth with a $4000.00 ticket to the FCC ball.

Right, but you also don't have to pay this until the FCC proves that you where illegal, and they WILL get a warrant when you refuse entry, as that is probably cause of illegal actions happening in the home or business! You agreed to the rules when you put a transmitter in your home!

NO probable
> cause

Yes, the probable cause was you not granting entry!

>and NO evidence to back up their suspicicions

Sure their was... Your neighbors where complaining of bleedover.

You have a transmitter.

They must take measurements, up to and including monitoring of your shack before they can say it was you.

This is called "Probable Cause".

Don't like it, don't agree to the rules.

For that to happen, you have to cease and decist with your transmitter!

which i must pay unless i
> go to their office and convince them of my innocince.

Or take to court.

Newsflash... Your going to lose. Should have granted entry in the first place.

> if i get a speeding ticket, i can choose to pay it and plead guilty or i
can go
> to court and not say a word and force the county to prove their case

against me
> without helping their case at all

Right. And then all that has to happen is for the cop to state that he got you on RADAR, or that he clocked you.

He shows that the RADAR gun has been run in accordance with the guidelines of calibration, and you are dead in the water.

Silent the entire time.

unlike letting the FCC in and giving them the
> evidence against me which flies in the face of my rights against self
> incrimination.

You really think it is any different?

Dont speed. You won't get a ticket.

Don't run a linear... You won't get busted.

> the FCC "rules" were written in exact opposite of these constitutional
> protections.

No their not. They give you a choice. Don't want to follow them, or allow the intrusions into your home or private space... Don't! Just make sure that you are legal...

Or, don't run anything that will cause you to fall under their jurisdiction!

And, you can see below to see more evidence of this:

> here in florida, when you sign your drivers license application, you are
also
> agreeing to take a blood alcohol test when asked by a law officer. this
too has
> a noble cause as it can help deter drunk driving. i am 15 years sober and

that if
> you refuse this intrusion into your body, (some localities require a blood
> test), you automatically loose your license for 6 months and your
insurance
> company raises your rates as though you were convicted of dui.

Because when you signed the papers getting your license, you agreed that if you refused a test, you where in essense pleading nolo contendre to the charge.

> there are some religions that ban alcohol use and also ban blood letting
or
> transfusions.

enough
> to make an antenna enthusiast jealous.
> all because he was exercizing his RIGHT to practice his religion by not
letting
> the state violate his body.

Yes, but he agreed to let it happen when he decided that he wanted to
exercise the PRIVILEDGE of driving!

Simple concept here. The government regulates both.

You agree to them when you

A. Get a drivers license
B. Operate a "licenseless" transmitter.

> same applys to my exercizing my RIGHT not to let the federal government
violate
> my home un-waranted.

But, you waive the right when you purchase a CB radio transmitter.

Simple concept, Jeff. If you don't want to have to let them in your home,
don't purchase and use a transmitter.

> what worries me is that more and more branches of the government will
bypass
> the constitution by instituting "rules" instead of "laws". big brother
will
> become more and more intrusive as time goes on and, eventually, the
> constitution will become as effective as the ITU treaties, ie; nill.

However, their is one thing that you seem to not want to face...

A law is something that deals with your freedoms or intangible items
(rights).....

A RULE is something that deals with a priviledge. Both operating a CB radio
station and driving a car are not your god given rights.

Toll Free

Oh come on, Jeff. That whole tirade above is pure misinformation.
The FCC does not just issue "Apparent Liability for Forfeiture" notices
to just anybody. They always have probable cause, and evidence, before
they go around handing out those notices.

This evidence may include RDF evidence, signal analysis, tapes of
actual broadcasts, sworn statements of others, and more. In other
words, they do not have to enter your home to establish that your radio
equipment is being operated illegally.

As far as entering your home is concerned, the FCC does not just enter
your home without a warrant. They knock on your door and ask permission
to enter. You always retain the right to refuse entrance.

Yes, if you refuse, you stand a good chance of getting a "Notice of
Apparent Liability for Forfeiture." But, since they already had enough
evidence to warrant an attempted inspection of your station in the first
place, you would probably get that notice no matter what you did.

If fact, the station inspection if more of an effort to establish the
innocence of the operator, not the guilt (they already think you are
guilty before attempting the station inspection). The inspection would

prove that your equipment is legal (in spite of evidence otherwise), and therefore eliminate any further actions by the FCC. Refusing the station inspection only means that the FCC must rely on its existing evidence, with already shows that you are operating illegally.

You always have to right to appeal a "Notice of Apparent Liability for Forfeiture," Jeff. You can appeal within the FCC system or you can request that the case be heard in a civil court. Of course, when heard in a civil court, the amount of potential liability may increase and you may also have to pay court costs if found guilty.

And, if you had refused a station inspection, the burdon falls on you to prove that their existing evidence is wrong. That is absolutely no different than any other civil court case. The prosecutor gives evidence that attempts to prove your guilt in the civil matter. Your defense is to prove that the evidence is wrong.

Show me a single case where the FCC has entered a home without the permission of the owner and without a warrant. The FCC does not enter your home without permission from you (therefore, they never seek a warrant). If the FCC wants to inspect your station, they will simply knock on your door and ask permission to enter. You are always free to say no.

Your radio signal does not stop at the state line of Alabama. It has the potential to affect the residents of other states (in fact, many other states). And it also has the potential to affect the residents of other nations. Therefore, the regulation of radio operation does clearly fall under the authority of the federal government.

Okay.

> and, by the same token, the hams have no right to complain when they get their
> hair scorched when they come here with their DF antennas on their heads like
> halos and presume that they have the power of God to tell anyone what to do.

Try not using drugs during these conversations, Jeff. You're having
paranoid delusions.

Sober up and try to listen to this one more time. We (the hams) are
not trying to tell you what to do. The FCC sets the rules for radio
use. We have a right to say that we agree with those rules. And we
have a right to give our opinion when you claim to break those rules.

But, we are not telling you what to do. We do not have to power to do
that, and we have never said that we do. And that fact that you are
still operating illegally, in spite of the fact that you claim that we
are telling you not to, clearly demonstrates that you know that. So why
do you keep repeating this nonsense in these newsgroups?

> we don't go to rec.amateur and troll for arguements there

Nobody is trolling for arguments, Jeff. You have stated that you
operate your radio illegally, and we have given our opinions about that.
If you don't want an argument, keep your illegal activities to yourself.

> this is true. if you want to comment for or against my activities and debate
> the issues, i welcome this with open arms.

Okay.

And the people who thought they were above the rules operated the concentration camps. There can be both good rules and bad rules. You have an obligation as a human being to follow the good rules, and an obligation as a human being to fight the bad rules.

But, a rule does not become a bad rule just because you as an individual does not like it, Jeff. If that were the case, the men who operated the concentration camps would have been justified in their actions.

But you have not established that the rules concerning CB radio use
are unreasonable or unfair (we are talking about CB here). Just because
one rule is unreasonable or unfair, it does not mean that ALL rules are
unreasonable or unfair.

In my opinion, for the reasons I have stated many times in this
newsgroup, the current rules concerning CB are reasonable and fair.

Again Jeff, you are attempting to mislead the readers of this newsgroup. Every single one on the ham operators posting to this newsgroup is also active on the CB band. Therefore, it is just as much their newsgroup as it is yours.

So, get off this our side of the pond versus their side of the pond crap. Since you know that we're also CB'ers (we've said it many times before), its intentionally misleading and therefore dishonest.

let's see. last night was saturday night.
a lot of people get drunk on sat. night.
that must be it as i can see no other reason for someone of your intelligence
to babble like this.
the laws against theft of personal property make sense and do exist. besides,
one could meet with great bodily harm in an attempt to take ones personal
property.
none of what you said has anything to do with the issue at hand.
this is another attempt to compare apples to oranges and doesn't fly here and
is just another attempt to side step the issue.
i recieved an e-mail from a ham this morning that answers many questions that i
have presented here with no sucessful answers.
i am awaiting his permission to reproduce it here. if i do get it, i will
reproduce it.
meanwhile, i'll send it to you privately along with some of my thoughts on the
subject.

Dwight Stewart wrote in...
Perhaps that is true, but he claimed contact with 112 countries. There are not 112 countries in Europe, nor are there 112 countries within the range of any CB radio in this country, no matter how much power it was running or how good the skip conditions are. So, like I said, impossible.

I'm sorry, but I do not buy this. As a matter of fact, I know for damn sure this is a crock o crap. I'll admit I have never contacted 112 different divisions/countries/terrotories/whatever-you-want-to-call-them.etc. yet with my 2510 on 11 meters, but I do know from looking at other freebander's log books and QSL collections that it IS possible to contact atleast 112 countries/divisions/territories/whatever-you-want-to-call-them/etc with a reasonable amount of power.
I was able to contact almost every country is South America one day while drivng down Interstate 94 between Detroit and Ann Arbor using 200w. This was a few years before I got my ticket. No, it's not 112 differnet countries, but not bad when your zipping down the highway on the way home from work....

I have three ten-foot pieces of Rohn25G plus bottom mounting plate that
I will part with in East Texas if anyone is interested. I'm about
equi-distant from Dallas/Austin/Houston.

>
>The FCC does not just issue "Apparent Liability for Forfeiture" notices
>to just anybody. They always have probable cause, and evidence, before
>they go around handing out those notices.

in a civil court forum, this is right. this what i said before. they have written the rules to circumvent the rules of evidence.they have twisted the legal system to suit their agenda.

> This evidence may include RDF evidence, signal analysis, tapes of
>actual broadcasts, sworn statements of others, and more. In other
>words, they do not have to enter your home to establish that your radio
>equipment is being operated illegally.

again, this is what i said before, these things, in a criminal court proceding, would be weak at best.
if i were accused of murder, any analogy of these things could be used to establish probable cause. without the murder weapon with my finger prints on it, (my radio), it is all circumstantial evidence and would be difficult, at best, to prove. under the FCC rules, i am required to give them evidence against me by allowing them into my radio shack to confiscate my equipment. all without benefit of due process and a warrant. the constitution just took another step down.
if the FCC were heald to the constitutional rules of evidence, they would loose 99% of the cases that they would bring before a judge.

.> As far as entering your home is concerned, the FCC does not just enter
>your home without a warrant. They knock on your door and ask permission
>to enter. You always retain the right to refuse entrance.

then, under the premise of being guilty untill you prove your innocence, you get an nal. again, against the constitution.

>
> Yes, if you refuse, you stand a good chance of getting a "Notice of
>Apparent Liability for Forfeiture." But, since they already had enough
>evidence to warrant an attempted inspection of your station in the first
>place, you would probably get that notice no matter what you did.

answered above.

>they already think you are
>guilty before attempting the station inspection).

i rest my case. the constitution suffers another blow.

>Refusing the
>station inspection only means that the FCC must rely on its existing
>evidence, with already shows that you are operating illegally.
>

in a criminal court, the govt. would have to prove it's case without my help.
in a civil proceding, i would have to fight to prove my innocence. again,
against the constitution.

> You always have to right to appeal a "Notice of Apparent Liability for
>Forfeiture," Jeff. You can appeal within the FCC system or you can
>request that the case be heard in a civil court. Of course, when heard
>in a civil court, the amount of potential liability may increase and you
>may also have to pay court costs if found guilty.

exactly my point. i have to prove my innocence. if i were to appeal a murder
charge, basically, i would go to court and say i disagree with this or that
evidence and the govt. would have to prove to the judge the evidence is still
valid. in a civil court, no matter if i'm innocent or guilty, the advantage
lies with the FCC and the burden of proof lies with me. once again, against the
constitution.

> And, if you had refused a station inspection, the burdon falls on you
>to prove that their existing evidence is wrong. That is absolutely no
>different than any other civil court case. The prosecutor gives
>evidence that attempts to prove your guilt in the civil matter. Your
>defense is to prove that the evidence is wrong.

answered above with one side note here.
criminal courts were designed to settle offenses against laws made by the
government in accordance with the constitution.
civil courts were designed to settle disputes between private parties that do
not concern "legal issues".
if i were to put my fence over your side of the property line or damaged your
house and refused to rectify the situation.
we would wind up in civil court.
if we got into a fight over these issues and i attacked and injured you in the
fight, we would wind up in criminal court as i had broke a "law" involving
asault and battery.
the FCC "rules" are not laws, written and passed by congress as they should be
because the intent of these rules are to control the entire public should
everyone choose to own a transmitter.
just like the highway department controls the public should everyone choose to
drive.
the highway department goes through proper channels to make and pass laws
wether through local or national law making bodies.
the way the FCC "RULES" should be written as laws, if i disturb my neighbor
with my RF activities and say, God forbid, i disrupt a 911 call and someone
dies, he should be able to report me to the FCC with my "LAW" breaking
complant. once cited, my neighbor could take me to civil court for redress of
his loss.
this is what civil court was supposed to be about.
the way it is now with the FCC, by your own admission above, it has used the

civil process to bypass constitutional rules of evidence and due process to expedite their agenda.
how many other govt agencys will catch on to this ruse and follow suit?
like i said before, O.J. was found innocent by a jury of his piers but he still owes $33,000,000.00 for something that a jury said he didn't do.
where's the logic in this?
i have nothing to hide but everything, (my constitutional rights), to protect.
jeff

I forgot to mention that you should please refrain from having channel competitions with other people. This will only cause the owner to shut the radio down.

He's already locked out the "Great Liberty Net" channel (3950) becuase it apparently offended some people.

The Liberty Net has really gotten some people so stirred up that apparently they will do just about anything to stop it.

I have heard conflicting modification procedures for the modulation for the Cobra 148 GTL ST.

They say to cut R131. (Yet I heard from someone that you should not cut the R131 if you have a radio with Sound Tracker).

Adjust VR10 for the AM power to max it out, (Counter clockwise)
Adjust VR11 for the SSB Power. (Clockwise)

Anybody know what to do with the R131 on a Sound Tracker (ST) Radio?

Thanks.

>
> jeff
Jeff,
the interconnection between countries on ANY type of telcommunications
is overseen by the ITU, The ITU was founded in 1859 to standardize
telegraph connections between European countries as to allow for the
rapid passing of traffic or messages. With invention of Telephone and
radio, the ITU assumed duties in regards with the Cairo Conferance of
1906 which set up an international standards committee which came up
with the phonetic allocation scheme (K,N, and W along with AA to AK for
the US, G and M for the UK, D for Germany, I for Italy and so on).
The ITU regulates the international usage of telephone, telegraph, data,
radio etc. It became a dept of the UN when the UN was founded in 1945
and before that it was under the League of Nations in Geneva,
Switzerland. The ITU is called a specialized dept of the UN and the
Telephone money is a great source of revenue for some small countries.
Radio is included since international conferences have delgated radio to
the IYU since 1906. The IYU has set up the international allocations in
regard to Marine, Business, military, amateur, radio telephone, medical

devices and other radio services. The standard ITU agreement cover any type of electronic communication and is many pages long with technical BS from DC to Light. Every country on this planet has signed the ITU agreement since international interconnection depends on ITU standarization. Some countries are not close followers of ITU and some have no central functioning governments but those that do (about 99 percent of the world) want that telephone money.

The FCC administers the Civilian Portion of this program in the US and the NTIA (see www.ntia.gov) allocates usuage in the US for government and military usage on the Federal Level. (Some of freeband is NTIA stuff!). The FCC and FBI have concurrant jurisdiction with NTIA stuff. SCARY...

On the International level, ITU allocations differ from region to region, most of the Western Hemishpere is in Region 2 (Ham Test Question). CB radio in North America (Canada and the US) is 40 channel AM type emission (called A3 in ITU parlance) with a limitation imposed by only the countries themselves. In Cntral and South America, These so called export radios can be used on different channels since each country can set their own standards. (Hint: 26 to 28 Mhz around the world has been allocated to individual countries usuage, so each country may set up its own type of radio service as it wants). The high power stations from the south are mainly business types since VHF and UHF radio are so expensive. Costa Rica allows usuage of up to 100 watts ERP on Radio Personal which is their name for CB. Belize allows Business usage radio upto 35 watts on CB with extra channels available. This will shed some light on why CB is low priority with the FCC. The only beef I could see with this arrange and the ITU is that the ITU agreement states that the general usuage band we call CB can not be used for international contacts. Unless some country complains, the FCC will only pay minimal duty to the CB Band, however, some countries have been complaining about our CB and Ham Bands which I think has sparked the current round of enforcement. CUBA has complained about interference to its ham nets and repeater systems (We do pay some attention to Cuba since most Carribean telephone and microwave links pass by and through CUBA by international agreement from Florida).

I would recommend looking at the FCC website, searching the UN and ITU with search engines, The ARRL has a portion (chapter) of the rulebook outlining the ITU and relationships.

The main reason I got an Amateur Radio License was to communicate with home and almost every country honors an Amateur license without fail, however, there may be some bookwork involved but recip licenses can be obtained and it clears the path for you to carry radio gear in some countries which have a different view about 2 way radio.

In Columbia, CB radios are illegal without licensure and possession of unauthorized radios will put you on a collision course with the local gendarmes. Had a friend who was a radio hobbist who worked in Columbia on a Drilling Rig in the Jungle. He brought his scanner and 2950

10/11meter radio and got through customs (Oil drilling equipment) but on
the rig, his radio skip chasing got quick notice form the Columbian
Authorities (HOW? I really don't know, but I suspect drug/guerilla
fighting). The legal hassle without a license cost him his job and
expulsion from the country. He was asked, he told them he was a Ham and
they asked for a licnese and found he wasn't licensed for Ham in the US,
he was told he would have been eligible for a reciprical license but
illegal operations were another thing. A $100,000 a year job lost.

Sure,
I welcome open discussion and the why becauses? Some Hams doen't know
the becauses due to the fact they never studied Radio History and Radio
Law and then the urban myths assciated with Ham and CB which both radio
active types and civilians have no concept.
Example: 1. FCC Enforcement 2. Local or State Enforcement 3. ARRL and
their volunteers 4. Emergency Operations 5. Powers and duties of
an OO 6. Power, Harmonic and interference 7. Federal Privacy Law
and other things.

Dispel the myths, get fact and ficton seperated and remember this:

Ignorance can be cured but hardheaded stupity can be terminal.
Listen and Learn and remember, research is the key to truth in Law.

Yes post me as you need to, use common sense and the truth is usually
quite logical, there is a reason for every rule (not that I agree with
the rules but they were created for a puropose.) :>

73 de Martin N5PZJ
if more hams would come here with accurate information as this gentleman has
rather than the RF police, holier than thou, "because I said so" attitude,
there would be a lot more dialog and education here than verbal bloodshed. take
a lesson!!!
THANK YOU MARTIN!!!

Greetings!

When you say "CB" This limits the field to CB-only radios.

The two that come to mind are full-function with AM and SSB, but don't
have WX.

Uniden Grant XL/LT.
Cobra 148 GTL.

The best of these two, are in favor with Uniden.

Simply, Uniden has maintained a better level of Quality while Cobras'
once stellar high-cost-but-worth-it reputation has been marred by
setbacks in both production and performance quality.

If you want WX, the bar lowers a bit and I would suggest...

Midland 79-290. Also includes AM/SSB but has WX and a removable
Faceplate.

Some compromises here, small buttons, less than ideal Noise Reduction
[ANL/NB] but does offer security and Weather. Small package a big plus
for interiors with small limited space.

If you were to say, "best of any 11-meter radio both Import and
Export", the field widens and I'm not even going to touch it...

While Dancing with the Mouse on Sun, 14 Nov 1999 14:20:07 -0500, the
Modem interrupted with an MNI from "Pat Dolla <pdolla@videotron.ca>",
and the MotherBoard buffered this to Video RAM:

<<let's see. last night was saturday night. a lot of people get drunk on sat. night. that must be it as i can see no other reason for someone of your intelligence to babble like this. the laws against theft of personal property make sense and do exist. besides, one could meet with great bodily harm in an attempt to take ones personal property. none of what you said has anything to do with the issue at hand. this is another attempt to compare apples to oranges and doesn't fly here and is just another attempt to side step the issue.>>

Not at all. I'm trying to point out that a great many of your present "justifications" for ignoring CB rules have a similarly delusional logic to them, that, as an otherwise reasonable person, you may not be aware of.

You continually compare 'apples and oranges' here, e.g.; the ARRL is like the Nazis...using illegal amplifiers is like Jaywalking....etc.

So stick to the issues, or call it quits.

I had 2 of these. I sold one and have this one left. It is a Leader LSG-227. It is almost like the B&K 2040 except it has digital readout. 2 meters and all that stuff are the same.This unit is an 8.5 on a 10 scale. The unit has NO RF output. I think it is the +5 volt power supply.

$100 plus about $12 to ship it to you.
(see it at...top center)

Greetings!

Just don't buy an ST when it comes to figuring out what to do with
R131.

Taking R131 out, and having ST, doesn't do anything for it. ST is the
actual "Bottleneck". I'm looking to find sites that actually have
removed the ST function, because I'll link to them due to the sheer
number of questions I'm Emailed about this ST verus non-ST stuff.

While Dancing with the Mouse on Sun, 14 Nov 1999 16:36:32 -0500, the
Modem interrupted with an MNI from ""Richard Camarata"
<rtcamarata@mediaone.net>", and the MotherBoard buffered this to Video
RAM:

:+> I have heard conflicting modification procedures for the modulation for the
:+> Cobra 148 GTL ST.
:+>
:+> They say to cut R131. (Yet I heard from someone that you should not cut the
:+> R131 if you have a radio with Sound Tracker).
:+>
:+> Adjust VR10 for the AM power to max it out, (Counter clockwise)
:+> Adjust VR11 for the SSB Power. (Clockwise)
:+>
:+> Anybody know what to do with the R131 on a Sound Tracker (ST) Radio?
:+>
:+> Thanks.

2379. I still own a CB, and I need web site hits....

Newsgroup: rec.radio.cb
Date: 1999-11-14 00:00:00 UTC
From: elwiii@macon.mindspring.com
Message-ID: <80nf5q$9l4$1@nntp8.atl.mindspring.net>
Source record: 10764

I really do still keep a CB in my pick-up - seems a tad more macho than a cell phone, and frankly, is easier to use.

My name is Ed Williams. About two years ago I wrote down some old wild ass country boy stories about my upbringing in the big city of Juliette, Georgia - the tiny community where the movie "Fried Green Tomatoes" was filmed. It is the only thing other than term papers that I have ever written in my life.

Through a series of flukes, these stories were published the summer of 1998 under the title, "Sex, Dead Dogs, and Me - the Juliette Journals." When I first saw it in some bookstores I felt distinctly like the Forrest Gump of literature.

The book sold several thousand hardback copies, to the point that my publisher, a tiny one out of Dallas, Texas, began having problems filling the orders. Accordingly, he reverted the rights to the book back to me and I currently have a literary agent shopping the book around to some larger publishers.

My agent called me and told me that an editor from a large southern regional publisher had contacted her and told her that she was going to look over my book during the next few days. She then added that she was going to review my web site as well.

This is where I need some help - my agent is telling me that we need to get as many web site hits as we can as it will help our book appear more viable to the publisher. Would ya'll possibly consider going over to my site and perhaps registering 1-2 hits? I don't even mind if you don't read one word while you are there, I'll still be grateful for just the hits alone. The URL is:

http://www.ed-williams.com

Thank you so much for any consideration you can give me.

Ed Williams

SPAMBOY.....This is not usually a good way to make friends. Show us you know more about radios than spamming the NG to move your radio crap and you'll get the customers.....not by thinking this is just a free place for you to dump on with ads for junk we can get anywhere. I think it would be safe to say that many of us on in this NG either ARE or HAVE BEEN dealers and know where we would go to purchase a radio if needed. There are surely others in here that are here to learn and discuss ideas and opinions and advertising spam id usually a good way to get your opinion quickly discounted down to your just wanting to move product. We have people in here that write for radio magazines, are amp builders, electronic engineers, truck drivers , and housewives too. Your wasting your time if you think spam is something that we need in here.

Tos:
No, God did make the 11 meter CB band, & every other freq. too. The 6th plank of the Communist Manifesto is what is evil. What about the USSR owning low freq. transmitters doing alleged damage to US ? Who is more evil --a 50kw 6th planker radio station, or an individual running 100 watts ? What about the wicked broadcasters on 52-890 mhz ? What goes on there is a lot more evil than some dummy splattering a few 10kc on 11 meters ! Dem TV stations have BIG linears, & when that E skip rolls, you can get their junk over 1k miles away!!!
Dave !!!!!

The only thing you would be flamed for is spreading disinformation.

However, those seem like decent caps..

A little low in capacity for a complete 15Kw broadcast transmitter,
especially using a pole-pig, but decent nonetheless.

Jeff,

Your getting out in left field with this.

Sorry bud, but I must interject into a thread that I really tried to stay away from:

> >The FCC does not just issue "Apparent Liability for Forfeiture" notices
> >to just anybody. They always have probable cause, and evidence, before
> >they go around handing out those notices.
>
> in a civil court forum, this is right. this what i said before. they have
> written the rules to circumvent the rules of evidence.they have twisted the
> legal system to suit their agenda.

No, they haven't. You agreed to the rules when you bought a CB and began to operate it. It is plain and simple.

>
> > This evidence may include RDF evidence, signal analysis, tapes of
> >actual broadcasts, sworn statements of others, and more. In other
> >words, they do not have to enter your home to establish that your radio
> >equipment is being operated illegally.
>
> again, this is what i said before, these things, in a criminal court proceding,
> would be weak at best.

Sorry, but they are not. You can prove with digital "fingerprinting" of a transmitters key-clicks that it is the only one.

The key clicks of a transmitter are the electronic DNA of said piece of equipment.

Then, they can fall back on field strength measurements.

These are all based upon scientific fact.

Their have even been court cases (I know of) out in California against people (for stolen equipment) that they used the digital fingerprinting of the keyclicks.

The people with the stolen equipment where busted.

It is legal, it is scientific, and it is fact.

> if i were accused of murder, any analogy of these things could be used to
> establish probable cause.

You contradict yourself.

If they establish probable cause, your GUILTY!

without the murder weapon with my finger prints on
> it, (my radio), it is all circumstantial evidence and would be difficult,
at
> best, to prove.

No, but it isn't. Digital fingerprinting can, and is, used to convict
people of misusing radios, causing interferience and out of band
broadcasting.

under the FCC rules, i am required to give them evidence
> against me by allowing them into my radio shack to confiscate my
equipment. all
> without benefit of due process and a warrant.

Yes.

Don't like it?

Don't use a radio.

Plain and simple.

If you don't like having to give blood or breath when a cop thinks your
drunk?

Don't drive.

the constitution just took
> another step down.

No it didn't.

The constitution protects your rights.

Operating a radio is not a right.

Neither is driving a car.

> if the FCC were heald to the constitutional rules of evidence, they would
loose
> 99% of the cases that they would bring before a judge.

They do have to hold to those rules.

Take a look at part 95 and part 97.

When you purchase a radio that falls under the amateur radio clause, and get
your license, you have given the FCC carte blanche to enter your premises
when they believe your causing a problem.

When you purchase a CB and operate it, you do the same thing.... That is a passive agreement, much like a verbal one, but holds water in court.

Don't think it would?

Go take a look at how many people have lost cases in the courts!

>
> .> As far as entering your home is concerned, the FCC does not just enter

> >evidence to warrant an attempted inspection of your station in the first
> >place, you would probably get that notice no matter what you did.
>
> answered above.

But, you didn't answer it.

>
> >they already think you are
> >guilty before attempting the station inspection).
>
> i rest my case. the constitution suffers another blow.

Where? Are you stating that a simple field strength reading wouldn't be able to tell if someone was running illegal power or not?

Hell, my twelve year old can operate a field strength meter!

>
> >Refusing the
> >station inspection only means that the FCC must rely on its existing
> >evidence, with already shows that you are operating illegally.
> >
>
> in a criminal court, the govt. would have to prove it's case without my
help.
> in a civil proceding, i would have to fight to prove my innocence. again,
> against the constitution.

No, in either case, the government would present it's facts, you would say that you wouldn't let them in. This, in and of itself is against the "rules" you agreed to when you began operation of the radio!

BAM!!!

GUILTY!

>
> > You always have to right to appeal a "Notice of Apparent Liability for
> >Forfeiture," Jeff. You can appeal within the FCC system or you can
> >request that the case be heard in a civil court. Of course, when heard

still
> valid. in a civil court, no matter if i'm innocent or guilty, the
advantage
> lies with the FCC and the burden of proof lies with me. once again,
against the
> constitution.

No, you decided that you would rather face them in court when you said "no"
to them when they asked to inspect your station.

Once again..

Don't like it?

Don't use a radio.

Simple.

The FCC has stated that if you want to use a radio transmitter in the US or
it's possessions, you have to allow for inspection upon other evidence(s)
that alledge you are operating illegally.

If they asked to inspect, you said no, and then they went to court and had
no evidence that the inspection was warranted, and on good faith, then you
would win.

However, since you BROKE the agreement that you entered into with the United
States of America, and the Federal Communications Commission, you are in the
wrong.

>
> > And, if you had refused a station inspection, the burdon falls on you

> the highway department goes through proper channels to make and pass laws
> wether through local or national law making bodies.

You must have really flipped your lid!

The highway department doesn't have to ask the voters what they want the
speed limit to be!

They set it at what they feel is right.

If they want to change it, they can ask, but they certainly don't have to!

> the way the FCC "RULES" should be written as laws, if i disturb my
neighbor

> where's the logic in this?
> i have nothing to hide but everything, (my constitutional rights), to
protect.
> jeff

Sorry, Jeff, but your argument just doesn't hold water.

Operating a radio is not a right.
If you don't like the way the rules are, then don't operate a radio, or move out of the US.

2404. Totally Out of Hand!

Newsgroup: rec.radio.cb
Date: 1999-11-14 00:00:00 UTC
From: Bob <bob@bob.com>
Message-ID: <382F84B9.E83A4461@bob.com>
Source record: 10789

Hi,

Well, this discussion is getting out of hand....I think everyone
is just going crazy and talking about different things.
Its come to the point where it seems everyone is just confused.
If you think trimming your coax makes great improvements,
and you spend time pruning it (instead of your antenna) - I say you are
wasting your time,
but hey, it's your time.

It's why there are so many articles in QST magazine that are repeated
over
and over ("My feedline tunes my antenna!", QST magazine) about SWR.
These misconceptions have been around as long as coax itself.

Handy Andy likes to point out that ***mobile*** antennas have a problem
with the coax becoming part of the antenna system. Mobile antennas rely
on
the car body for the "ground plane" - its literally part of the antenna
system.
Since the connection to the car body is usually bad and the length of
the car body isn't the same as the shaft length - a certain condition
occurs.

Instead of the antenna currents being canceled out, current flows
back down the *outside* of the shield (braid) of the coax.

(The technical term for this is "common mode currents")

The coax actually becomes part of the antenna system. Therefore,
changing
the length of the coax actually *will change* the SWR.

HOWEVER - this is NOT a desirable OR normal condition, and you should
strive
to eliminate it. In fact, it's really a malfunctioning antenna system.
Coax is merely suppose to transfer energy from the radio to the antenna
(RG stands for Radio Guide).

On base antennas - this usually isn't a problem. Beams have
gamma-matches or
baluns that de-couple the antenna FROM the feedline - eliminating
common mode currents. Therefore, when this condition IS NOT happening,
changing
the length has no effect on the SWR.

Furthermore, feedline radiation (caused from common mode currents) skews
radiation patterns of beams and destroys gain and antenna efficiency.

Handy Andy also points out correctly, SWR meters suffer design problems
really making them a very inaccurate tool. If you change the length
of your coax and your SWR does change - this doesn't only mean you
have a common mode currents problem. The SWR meter could be in error.
(usually the lower your SWR - the more accurate the reading is).
This stems from several internal design flaws - cheaper SWR
meters are worse. I classify most internal SWR as useless.

So what does this all mean? When you have a properly functioning
CB antenna system - changing the length of your 50 Ohm coax will not
actually change the SWR - at any point on the coax line.
Of course, there are a few more unusual conditions that can cause SWR
to change - but if your system is working correctly - this won't
happen!
|
|
|
\ /
|

Now, some guys here know that changing the coax length changes how well
their radio "loads" (or couples) to the coax. They found changing the
coax
length effects how much power the get into their coax. Simply
said, changing coax length does effect what impedance your radio "sees"
where the coax hooks to the radio. This impedance is a complex function
of the antenna feedpoint impedance and coax length.

The closer this impedance (the combination of the antenna's feedpoint
impedance
and the effect of the coax length on the impedance) is to the impedance
of the final Power Amp's impedance, the more power that actually goes
into
the coax (guys with tube finals don't have this problem, they have a
built
in matching network).

Instead of changing the coax length to get better coupling - you could
use
an "antenna tuner", which has the same effect as changing the coax
length.
(Antenna tuner is in quotes because it doesn't actually tune the
antenna,
it tunes the feedline!). The mismatch ******STILL******** exists at the
antenna
feedpoint!

")====}lllllllllllllllll}>------" wrote:
>
> OK MR. Coax, answer me this, does trimming the feedline affect the SWR of a

> endfire array?

I don't know what you mean, endfire arrays usally have an impedance of
over
1000 Ohms - you don't use coax to feed them. I am strictly speaking of
typical
CB antenna fed with 50 Ohm coax...not ladder-line.

>and what about the phasing? will trimming the coax change the
> phasing? IM interested in seeing your answer this. Now we would be taking
> readings at the xmtr and this is 50 ohm coax.

Phasing? To the single antenna - what difference does the phase that the
current
is in when feeding the antenna? This doesn't have an effect on SWR.

What I am saying is - tune your antenna - its what counts. 50 Ohm Coax
length
is meaningless and unimportant to the properly functioning CB antenna.
It should be kept as short as possible to minimize loss.

BoB.

It think that both of you might have missed the point. Linears themselves are not evil nor are they the work of Satan. It is their use that is the work of Satan. It is written that we are to obey every ordinance of man (1 Pet 2:13). It doesn't matter if you agree with that ordinance. It is against the ordinances of man to use ANY amplifier no matter how small or large on 11-meters. You must agree that those who are in rule over you are there because GOD put them there. Evil people get evil rulers, I believe that is why God allows evil governments like Communists and other evil dictators. We are on the verge of another evil ruler here in America if we are not careful! If there is another democrat in the White House, Al Gore, I believe it will be then end of America as you and I have known it. Pray that we get a Republican or at least a real God fearing American in the leader's chair. BTW Dave, a 50kw station is a small station. Most FM radio stations in the US are 100kw. Most TV stations are 2 mega-watts or greater. Most VOA (Voice of America) stations are at least 25kw, some 100kw and larger.

Kevin

Simple thinking skills tells you that 6000 Watts of power output will draw over 10KW of power and a 250 amp alternator aint gonna cut the mustard! (Or maybe your amp is the thing that really isnt cutting the mustard)

Greetings!

While I have faced a series of set-backs with setups I've done, most of the problems arise from Frame to Finish metal.

Well, it would be a long story, but one of the quick tricks is to not worry too much about "bonding" everything, it's not truly practical. If you have the time to do it, some of the rewards are nice, but you really should focus on the other aspect of getting most out of the metal you have.

The easiest way to demonstrate this, is to remember the old days and those older vehicles that tended to rust away at either a door hinge, or handle - where a simple bolt held it on the vehicle.

Those days are gone now, and if you look into how they fixed a lot of these problems, are thru the use of plastic spacers, nylon washers and PVC enclosures.

A few newer vehicles I've come across, and I don't know if this applies to all of them either, have some form of road-noise isolation for quieter rides. Although fine for most, a bane for a CB'er.

If you remember, one trick to help reduce noise is to bond the muffler to the frame of the vehicle.

Doing this on some vehicles, may actually increase noise.

The fix is simple. You don't simply "bond" the muffler to the frame with a simple drilled hole and a bolt. You tie the muffler to the frame and shell of the vehicle - you bolt it to ground at two locations close to the muffler - the hanger bolt attaching it to the vehicle and a short distance away, the Unibody structure. The nuts used to accept the muffler bolts may be only epoxied onto the shell, the additional bolt provides the direct connection.

These vehicles are Unibody - or seam welded and placed on a small and short frame that can withstand the torque produced by the motor, and able drag everything attached to it.

These connection points to the frame are isolated with rubber washer and spacers to provide movement for flex during high tourqe and lower road noise passed into the passengers, but can electrically insulate themselves from the two halves. The frame and shell are tied together at some point with some simple wire jumpers. Albeit simple, they appear to RF as useless.

My emphasis on this, is to make sure the frame and shell are bonded together more than a door panel. Many vehicles are painted first then assembled. Just loosen a bolt or two on the fender panels and tighten them back down helps loosen the painted threads and make a better connection needed to "bond" that part to the whole of the vehicle.

This method helps a lot in cases where the Fenders and even the hood latch, can increase the vehicles ability to conduct RF.

I don't recommend loosening and attempting to re-tighten the door hinges, you'd be better off using a braided ground strap on these parts. It's very difficult to get a door realigned to shut properly unless you have two or three people to help hold the door in alignment as you re-tighten. Unless you like to remove interior trim to hold it yourself...not fun.

Here's another trick, and a local store sells them. Its' a conductive grease with copper fillings suspensed in the fluid. You can remove a bolt, spread some of this conductive grease onto the threads, and then retighten the bolt. Bingo, good ground with corrosion resistance!

Works good for getting longer life out of battery cable connections too, but wonderful for taming noise and better conduction of key electrical connections needed to get the most out of your vehicle.

While Dancing with the Mouse on Sat, 13 Nov 1999 10:02:38 -0600, the Modem interrupted with an MNI from ""ice cream man" <pinhead_16@hotmail.com>", and the MotherBoard buffered this to Video RAM:

What we are promoting is courteous, respectful operations and further development of the CB Radio Service.

There are many on the "freebands" who while breaking the law (or rules for the sake of rec.radio.cb) operate in a fashion that would be approved by many, excepting their out of band transmissions. There are those who use amplifiers or modified radios to increase output levels. As long as they are not using them in a mischievous or haphazard manner and want to see a change, they are welcome to be a part of the process. It's our hope that one day there won't be a need for amps or operating out of band by virtue of rule changes and better operating practices.

The fact of the matter is, I or anyone else has never denied membership to anyone so long as they filled out the membership form correctly. The whole concept of USCBOA is that if you join, you have a voice. Your voice, your chance to influence what we do to try and effect a change in CB radio. There are those in our ranks who operate illegally, those that do not. The common thread is that they practice good operating procedures, or are trying to anyway, and they want to see a change.

It seems that our ambiguity on the legal/illegal topic has caused some speculation. We that started the organization, happen to believe that there are problems with the Part 95 rules as well as with the lack of courtesy that permeates the band. This was evidenced in the poll that you referenced. I once thought that you could sum up the problems of the band simply as legal/illegal. When I gave the issue some thought, I had to question whether the rules have a roll in that. Obviously, laws that are grossly un-abided by many, aren't that practical. That's when I came to the conclusion that the problem lies on both sides of that particular fence. If we are to represent CB operators, then we must welcome all who want to see better communications on the band.

As I mentioned above, the whole idea of the organization is that everyone has a voice. I don't run it, although I do much of the work right now. Slowly others are taking on those responsibilities. When the ground work is laid, it will run on democratic principals. Members will voice their opinions to representatives who will then vote on the outcome. A person will preside over them, but only to conduct the process, not to influence the outcome. And hopefully, with a bare minimum of politics. If I have anything to do with it, the first person to bring up Roberts Rules Of Order will be tar and feathered <grin> We don't need political infighting and people on power trips. It gets everybody nowhere. That has been the downfall of many groups who had the chance to do something constructive. That and what color the hats, shoulder patches and tee-shirts will be. All of that is nonsense. We don't need any of that. There are enough hats and tee-shirts in the world already.

As for the recent petition, that more or less fell in our laps. Alan Dixon wrote it and handed it to us on a silver platter. He's had experience with petitioning the FCC for rule changes in the past. His advice was to start with the one most likely to succeed, and go from there. The DX limit actually came second in the poll with the freeband issue coming in at first. We were working on bringing people into the organization who could help us in such matters when Alan handed us the petition and asked how to join. We are very grateful to have him.

We have had the good fortune of having people in the organization from it's start that had connections to some very resourceful and influential people.

We do not charge anything for membership. There is a link on the site for those who wish to make a monetary donation, but that's it. We are doing everything on volunteer power right now. There are many who want to see CB stick around for the long run, and make it a better place. We recently had the good fortune of acquiring a sponsor who's generosity will pay for many of our administrative costs and get our web site on it's own domain name and a server.

I'm through arguing over what's bad about CB and how to change it. The people who joined me in the effort feel the same. It's time to actually do something about it.

We are having our second "net" by voice over the internet today (Sunday, November 14) at 1100 EST. We use a free program called Firetalk for this purpose. Anyone is welcome to join in. If you go to our web site at http://home.att.net/~uscb_association you will find all the information and links you need to download and setup the software.

And so there will be no speculation on the results of the poll, they are listed under my sig.

73
Jim USCB-9

Poll Results of USCBOA Poll #01
July 1999 to November 1999

Total Number Of Surveys Taken: 105

1. Many people who have been involved with CB since the 70's feel that when the FCC stopped issuing call signs, it allowed too much anonymity on the air, leading to the lack of courtesy and respect we hear on the radio today. Do you agree with this statement?

Base: Total Votes 102

51 (50%) Yes
40 (39%) I agree with it some.
11 (11%) No

2. It has been proposed that this organization maintain a database of call signs and handles that can be referenced to the operator's name and address. This information would be made available to the organization's members via the internet. Do you think this is a good idea?

Base: Total Votes 102

68 (67%) Yes
34 (33%) No

3. Do you feel that changes are needed to the current Part 95 CB regulations?

Base: Total Votes 104

102 (98%) Yes
2 (2%) No...Skip to question 11.

4. If you answered yes to question 3, are you in favor of opening the "Freebands" to CB?

Base: Total Votes 104

88 (85%) Yes
16 (15%) No

5. If you answered yes to question 3, are you in favor of increasing the distance we are allowed to communicate under Part 95?

Base: Total Votes 102

95 (93%) Yes
7 (7%) No

6. If you answered yes to question 3, are you in favor of allowing FM communications on CB?

Base: Total Votes 103

83 (81%) Yes
20 (19%) No

7. If you answered yes to question 3, do you feel that the current power output limit of 4/12 watts should be increased?

Base: Total Votes 103

76 (74%) Yes
27 (26%) No

8 If you answered yes to question 3, which of these changes do you feel is most important?

Base: Total Votes 99

52 (53%) Opening the freebands.
24 (24%) Increasing the DX limit.
8 (8%) Allowing FM communications.
15 (15%) Increasing power output.

9. If you answered yes to question 3, which of these changes do you feel is second most important?

Base: Total Votes 97

25 (26%) Opening the freebands.
48 (49%) Increasing the DX limit.
12 (12%) Allowing FM communications.
12 (12%) Increasing power output.

10. If you answered yes to question 3, which of these changes do you feel is least important?

Base: Total Votes 98

8 (8%) Opening the freebands.
12 (12%) Increasing the DX limit.
52 (53%) Allowing FM communications.
26 (27%) Increasing power output.

11. What role, if any, do you feel that this organization should have in policing the ranks of CB operators?

Base: Total Votes 104

12 (12%) None. That is the FCC's job.
67 (64%) A passive roll. We should set an example of courteous and respectful operations on the air for others to follow.
25 (24%) An aggressive roll. We should actively seek out offenders and turn their names over to the FCC.

12. Some people believe that one of the functions of such an organization should be to make available to it's members certain

products and publications pertinent to the CB hobby. The profits of such enterprises should then be used to fund the organization's activities. Do you agree with this statement?

Base: Total Votes 102

59 (58%) Yes
38 (37%) I agree with it some.
5 (5%) No

13. The only focus of this organization should be to represent the members to the FCC and other governmental agencies. Do you agree with this statement?

Base: Total Votes 104

38 (37%) Yes
42 (40%) I agree with it some.
24 (23%) No

14. How should this organization be financially structured?

Base: Total Votes 102

62 (61%) Non-profit
37 (36%) Not-for-profit
3 (3%) For-profit

15. Should this organization publish a newsletter?

Base: Total Votes 104

102 (98%) Yes
2 (2%) No

16. If you answered yes to question 15, how should this news letter be sent to its members?

Base: Total Votes 103

33 (32%) Via email only.
62 (60%) Via email and snail mail.
8 (8%) Via snail mail.

17. Are you willing to donate time and effort to help with the administrative functions of this organization?

Base: Total Votes 100

18 (18%) Yes
37 (37%) Yes, but on a limited basis.
45 (45%) No, I don't have the time.

18. Even if members donated time and equipment to this organization to conduct it's administrative functions, funds may still be needed for things such as web hosting, advertising and telephone service. How

do you think such funds should be obtained?

Base: Total Votes 102

20 (20%) Through charitable contributions.
27 (26%) By charging dues to the members.
47 (46%) All of the above.
8 (8%) None of the above.

19. If you answered "By charging dues to the members" to the above question, what do you think is a fair amount to charge?

Base: Total Votes 78

45 (58%) Less than $15 a year.
27 (35%) $15 to $25 a year.
6 (8%) $25 to $35 a year.

20. If this organization had an official web site, should it offer advertising on it's site to CB related enterprises to help offset administrative costs?

Base: Total Votes 103

97 (94%) Yes
6 (6%) No

Hi folks

I am living in the UK, but next year I will be moving to Australia. To be more precise, Coffs Harbour in north east NSW.
I would like to hear from any CB enthusiasts in Australia, and particularly in the Coffs area. I am very interested in your UHF system and I'm also a licensed ham, so I'm looking forward to getting "radio active" when I arrive.
If you can offer any advise about aus CB, or send me relevant website addresses, or just fancy a chat about CB or radio in general. Please drop me an email.

cheers all
Jack

>figure out where to mount it in my 96 chevrolet cavalier. i was going
>to try mounting under the ashtray,

Do you have the center console? If so the back side of that is a good place tp
mount it. Use double sided tape if you dont want to drill holes in it.
Another good spot is between the visors. Coax can be hidden underneath the
head liner and in the the panels along the doors(pwr cord too). just a couple
of chioces to go on.

OK- Let me make it simpler for you Mr. Toll Free. I dont want to run 6KW for 10 seconds per battery. Most people that run that kind of power are not doing it with 12 volts (thats a whole other topic) which goes back to the even simpler formula of Ohms Power law (Power = Voltage X Current). My point is still that if you are running a box that is supposedly doing 6KW out, a 250 amp alternator is not going to keep up with it, at least not for very long. A good class AB2 amp(most of you are running class C by the distorted sound that I hear across the band) is only 55% efficent and would have to draw close to 12000watts of power from your alternator and battery(s). That equates to 1000amps. You are very correct that if I parallel a bunch of batteries this can be acheived but keep in mind that batteries are supposed to have 10 to 15% more alternator voltage to keep them charged and the specs for most alternators state that the total current drawn from an automotive system should never exceed the output of the maximum alternator current by more 10-15% for short periods of time. Now keying up for 10 seconds is a short period of time but the huge load placed on the alternator after you pull 1000amps from you batteries will still exceed the alternator ratings by many times its output current for a much longer time until they are charged up again. But then why am I explaining this to you? The simple way is to pull out your check book, buy a bunch of batteries, keep burning up alternators, wasting batteries, money and equipment rather than doing it the right way.

Jim

It works wonders in my radio. I don't have a means to test distortion, but the area folks say it sounds clear, even though it is loud. And believe me, it gets LOUD.

When I first installed mine, I was unsure of the settings, as I was using it in combination with a D104. I flipped the switch on, and people told me it was too loud. They had to turn their volumes down, but then they were barely able to hear anyone else besides myself...

Well, I'll be damned..

Jim here only wants to argue, and not realize that he is agreeing with me!

Jim, why don't you go back and look at the exchange I was having with the dummy and find out that I was not advocating this style of operation, just stating that it could, and has been, done.

Then, I guess I will have to show you a thing or two....
> OK- Let me make it simpler for you Mr. Toll Free. I dont want to run 6KW for 10
> seconds per battery.

>>>1. Who said per battery? Usually their is a bank of three batteries, and when running this type of power, you are running at 16 or 18 volts, by series / parralleling either two 8 volts or a mix of 6 and 12 volts.

>>>2. So you don't want to see that kind of power for 10 seconds. This means shit to me. I am, and was then, talking of a shootout mobile setup. You can get by with less alternator in a shootout mobile, and this just reaffirms what I told the dummy when I said that it wouldn't hold it for 10 seconds.

>>>I really wish they had a school on-line to help people with reading comprehension skills. This newsgroup is really lacking!

Most people that run that kind of power are not doing it
> with 12 volts (thats a whole other topic)

>>>>Your right.

>>>>See above. We do it with 16 or 18 volt systems.

>>>>That was already stated. Your slow to catch on.

which goes back to the even simpler
> formula of Ohms Power law (Power = Voltage X Current). My point is still that
> if you are running a box that is supposedly doing 6KW out, a 250 amp alternator
> is not going to keep up with it, at least not for very long.

>>>>And that is exactly what I stated. Do we need to go back to the original thread and see what was said, or are you just in the business of arguing and making an ass out of yourself by quoting selectively?

A good class AB2
> amp(most of you are running class C by the distorted sound that I hear

across
> the band) is only 55% efficent and would have to draw close to 12000watts
of
> power from your alternator and battery(s).

>>>Class AB doesn't enter into the equation. We use Class C,. non-biased boxes with what we use for competition. Enter 75 (or so) percent efficiency.

That equates to 1000amps. You are
> very correct that if I parallel a bunch of batteries

>>>>Not a bunch. The gell cell batteries that I run hold 1100 amps at 12 volts for a good 8 seconds, and that is after not being charged for a while.

this can be acheived but
> keep in mind that batteries are supposed to have 10 to 15% more alternator
> voltage to keep them charged

>>>Duh... And on a 16 volt system (2 8s in series), we charge them about 18.5 volts.

>>>On a 18 volt system, I charge at 20 to 21 volts.

and the specs for most alternators state that the
> total current drawn from an automotive system should never exceed the
output of
> the maximum alternator current by more 10-15% for short periods of time.
Now
> keying up for 10 seconds is a short period of time but the huge load
placed on
> the alternator after you pull 1000amps from you batteries will still
exceed the
> alternator ratings by many times its output current for a much longer time
> until they are charged up again. But then why am I explaining this to you?
The
> simple way is to pull out your check book, buy a bunch of batteries, keep
> burning up alternators, wasting batteries, money and equipment rather than
> doing it the right way.

Gee, Jim, you just paraphrased what I had told the dummy.

Congratulations. You just became a parrot.

All that, just so you could argue. Where proud.

Greetings!

Smoked R 183? Well, thats a 10 ohm resistor. Brown Black Black.

It belongs to the emitter of TR39. A 2SC1973. The wrong place to work
on getting more power.

Try replacing it, and getting the Radio to TX again.

Once thats done, a search for mods on the radio can reveal a lot of
different ways to accomplish the job.

While Dancing with the Mouse on Sun, 14 Nov 1999 15:36:31 GMT, the
Modem interrupted with an MNI from ""Dogadeer"

SPAMBOY.....This is not usually a good way to make friends. Show us you know more about radios than spamming the NG to move your radio crap and you'll get the customers.....not by thinking this is just a free place for you to dump on with ads for junk we can get anywhere. I think it would be safe to say that many of us on in this NG either ARE or HAVE BEEN dealers and know where we would go to purchase a radio if needed. There are surely others in here that are here to learn and discuss ideas and opinions and advertising spam id usually a good way to get your opinion quickly discounted down to your just wanting to move product. We have people in here that write for radio magazines, are amp builders, electronic engineers, truck drivers , and housewives too. Your wasting your time if you think spam is something that we need in here.

Yes, but this is the fact...

The ITU treaties serve the FCC well, so they will choose to continue to enforce them.

Makes money.

And that is the way it is:

There was no reason to address the possible results of a refusal to allow a station inspection. My comments were addressing only the claim, in the message I quoted, that the FCC entered homes without permission or a warrant.

Yes, as I said in another message, you will get a "Apparent Liability for Forfeiture" notice if you refuse to allow a station inspection. But that has nothing to do with your refusal. The FCC already had evidence of illegal operation before attempting a station inspection. The station inspection is designed to either prove your innocence or gather more evidence.

Of course, I have already said this in another message.

The rules concerning CB radio make sense and do exist. I don't see a
big difference between the two.

Are you saying that we should change the laws to make the illegal
operation of a radio a criminal offense similar to murder? The rules
concerning radio operation is a civil matter and should remain in the
civil courts.

> > This evidence may include RDF evidence, signal analysis, tapes of

People have been sentenced to the electric chair on far less evidence
(sworn statements, taped conversations, etc.). It is more than enough
to argue before a civil court judge.

> if i were accused of murder, any analogy of these things could be used to

We've already covered this. The FCC does not enter your home without
a warrant. Lets not keep going over the same old ground.

> if the FCC were heald to the constitutional rules of evidence, they would loose
> 99% of the cases that they would bring before a judge.

They are held to the rules of evidence concerning civil proceedings,
not criminal proceedings.

> in a criminal court, the govt. would have to prove it's case without my help.
> in a civil proceding, i would have to fight to prove my innocence. again,

> against the constitution.

In a civil proceeding, both you and the FCC would have to present evidence. And each can challenge the other's evidence. That sounds pretty fair to me. And, since the constitution allows for civil proceedings, it is constitutional.

> exactly my point. i have to prove my innocence. if i were to appeal a murder

> evidence and the govt. would have to prove to the judge the evidence is still
> valid. in a civil court, no matter if i'm innocent or guilty, the advantage
> lies with the FCC and the burden of proof lies with me. once again, against the
> constitution.

That is absolute nonsense, Jeff. In a civil court, neither side has an advantage. Both you and the FCC would have to present evidence. The FCC would have to argue their case against you. And you would have to present argument that supports your position. The judge decides only after hearing both sides of the case.

There is no automatic assumption of guilt in a civil case, nor an automatic assumption of innocence. Unlike a criminal court, where you are assumed innocent until proven guilty, in a civil court both parties on equal ground going in (you are not assumed to be innocent or guilty - you are just a person who disagrees with the another party).

> criminal courts were designed to settle offenses against laws made by the
> government in accordance with the constitution.
> civil courts were designed to settle disputes between private parties that do
> not concern "legal issues".

Civil courts were designed to settle civil disputes between anybody. That includes individuals, groups, companies, corporations, or government agencies. There are no laws which place a limitation on the parties in a civil dispute.

I gave you the benefit of the doubt, Green. I said "even if
everything your say here is completely honest..." However, I have my
doubts that it is "completely" honest and stated that.

That is a valid opinion considering the absolute nature of your
statements. For example, you claim that you "don't bleed on my
neighbors TV or any other electronic gear either." Now, unless you have
talked to each of your neighbors, and have tested each item of
electronics owned by them, that would be impossible for you to know for certain.

Therefore, that statement cannot be "completely" honest. It is only
conjecture based on the fact that you have not received any specific complaints.

Sorry Aaron, but you're twisting the argument to support your opinion.
He did not say divisions or territories. He specifically said
countries. And therefore, I stand by my argument - it is impossible to
contact nearly half the countries in the whole world with only a 25 watt
radio and an Antron 99 (which is exactly what he claimed that he had done).

> CAN be done.. although I've yet to see proof of it BEING done.

The person claimed to have contacted 112 countries with a 25 watt radio and an Antron 99. Since there are only 260 countries in the whole world, that would mean that he has contacted nearly half the countries in the whole world (on ll-meters and with that radio equipment).

Far more than half of the world is out of the skip capabilities of 11-meters. For example, it would be impossible to contact China with a CB radio in New York. An 11-meter signal simply cannot skip that far (no matter how much power you are using - and it is absolutely certain that it cannot be done with a 25 watt radio and a simple antenna).

However, since you have seen "proof" that it can be done, perhaps you would like to share that "proof" with us. Until then, perhaps you should be careful who you are calling a "pompus, self-righteous ass." Someone might apply that phrase to you.

Greetings!

No, TR34 ALC sense/amp connects to TR25 AMC/ALC amp.

R131 affects TR26 AMC sense/amp.

<Why? This is where it gets long winded. Readers are invited to comment...>

The bad thing about TR26, is the inherent fault of placing the emitter on the AM regulator output line to the finals, audio is always applied to the emitter versus using the base and running it as a limiter versus a regulator in itself when the radios' in AM mode.

It conducts when the base voltage reference done by R131 and R130 affects the emitter voltage off the sense line from AM regualtor. It begins to begins to fall when audio is applied. Falls too far, the emitter of TR26 is at a lower reference voltage than the base, and begins to conduct, pulling TR25s' base low and this forces TR25 to work. By sensing the dropping DC voltage, this circuit operates to prevent negative peaks from forcing cuttoff at the Finals. The forward swing is allowed, but C109 acts as a peak/hold filter that recovers thru a series of set limiter resistors.

It's a cascade effect. Under SSB mode, this automatically biases off TR26 [straight 12V reverse biases the emitter but the collector acheives a high impedance 8 volts to provide a reference to TR25 due to what R131 and R130, along with R129/R128 provide to the sense line].

In SSB, TR34 runs TR25 instead. TR25 conducts when it's base voltage is pulled below the reference voltage R129/R128 gives from the line shared by the collectors of TR26 and TR34.

Due to the biasing of the base of TR26, the collector output is a steady voltage, but at a high-impedance set by R130 and R131 and TR25's R128/R129.

A small change in voltage on TR34's collector affects the collector of TR26 and the base of TR25, and TR25 acts like a switch and changes it's state [due to the bias reference of R129/R128] and a capacitor 10uF acts like a filter and also something to work against when the charge removed from C109 is recovered due to biasing R128/R129/R130/R131 provide. That in turn forces the AF limiter TR24 to conduct.

In AM mode, 8 volts constant is applied to the emitter of TR34, so any sensing of envelope exceeding a refrence TR34 wants to conduct on, it can't, no current flows because the emitter is reverse biased.

Whats a pain, is you'd think that simply removing TR26 would take care of the problem right? Alas, it's not that way. A voltage needs to be present to make TR25 remain off, and because of the 8 volt constant used to regulate the base of TR26, this is where the ALC works against a set value, and TR25 remains off until TR24 pulls this reference voltage low enough to force TR24 to conduct and limit audio. R128 offers high-impedance to TR34, but will always have a voltage present on it due to the forward voltage drop of TR26's collector to base and R130. So, it will always provide a voltage sense and is why TR26 needs to remain there. The collector to base drop is only .7 volts, but R130, along with R128/R129, gives TR34's sense line some reference, only at a high impedance, and a slight change of this line and TR25 acts like it did before. R128 drains off R129's reference from 8 volts constant.

[condensed from my notes over a Cobra 148 - due to labeling and additional changes, some parts noted above may vary from 148 to 148 ST models.]

There's ways around this of course, but TR24 being removed or R131, is the down and dirty way, except removing TR24 is inherently affecting both modes and is a lot dirtier in results.

Removing R131 takes care of the 8 volt reference TR26 needs, it then remains conducting due to R130 keeping the base reference to ground, but keeping the emitter effectively "off" all the time - no matter what voltage may be present at the emitter. The radio is not capable of dropping that much in AM regulation voltage on the emitter to go below base reference R130 has.

But, due to the bleedoff of R129 from the base of TR25 and R128 and forward voltage drop and bias of collector to base of TR26 and R130, this reference voltage is close to, but not quite at the same voltage had R131 been in place.

Hopefully I have this right...;-)

While Dancing with the Mouse on Sun, 14 Nov 1999 19:24:04 -0500, the Modem interrupted with an MNI from ""Richard Camarata" <rtcamarata@mediaone.net>", and the MotherBoard buffered this to Video RAM:

I think we are peaking out by the middle of next summer. However, February-March are typically gangbusta' skip. Even at the bottom of the sun spot cycle there are openings. The farthest I've got lately were south asia and south africa. The regular 40 channels are hopeless though. It's pretty much impossible to break through the garbage unless you are runnin' some big amplifier. 27.555USB (channel 55) seems to be the calling frequency and stations QSY from there. This is quite illegal, of course. I've had the best luck in the early morning myself. Skip seems to switch from east/west to north/south as you get later in the day.

2489. The real truth, MC 10kw Jesus

Newsgroup: rec.radio.cb
Date: 1999-11-15 00:00:00 UTC
From: Bob <bob@bob.com>
Message-ID: <382F959E.C5033698@bob.com>
Source record: 10874

MC 10kw Jesus,

You are totally correct, a 1/2 wavelength line of coax does
present the impedance of the antenna feedpoint back to the radio.
Also, you do a good job describing how to accurately prune
your coax line to a certain wavelength. You also accurately
state that the SWR would be 1.3:1 on that mobile antenna.
(more accurately, the 102" whip - shorter whips have
a lower impedance (than 36 ohms) and have a greater mismatch).

You totally commit the crime saying the 1/2 wavelength
of coax is magical and is capable of raising performance!!!

MC 10kW Jesus wrote:
>
> Size does matter......how to trim your coax for best performance.
>

You seem to miss the point that the impedance of the load
the finals "sees" DOES NOT have anything to do with SWR. The real
mismatch condition occurs at the antenna feedpoint -
like I have said 10 million times. Try thinking for yourself.

SWR is a ratio of forward to reflected power -
how much power is going down the coax and how
much is being reflected back - is constant
at all points on the line.

I used to share your exact beliefs until
I studied this closely and asked lots of questions.
This exact conversation has occurred a million times and will occur
a million more - but I won't be happy until
you really understand it.

If you don't believe me..here is some more supporting
facts...here is the same (huge) conversation with some real
antenna experts....you can find this on by searching
past posts on deja news. This thread was the best
thing I have ever read anywhere.

> Isn't it true that if coax isn't terminated (loaded,
whatever you
> want to say) in its "characteristic impedance", the
impedance
> at the feed end will be a mix of the antennas

impedance components
> and some added components of the coax?

Actually, it's the antenna impedance transformed to a
different value by the
transmission line. The transmission line length and
impedance as well as the
load impedance determine what you see at the input
end. In that sense it's a
"mix" of the two impedance's.

> I am pretty sure
> that at 1/2 wavelength multiples on the coax, the
impedance
> components of the antennas feedpoint (resistance and
reactance) are
> mirrored (without additional impedance components of
> the coax).

Yes, as long as the feedline loss is negligible, this
is true.

> Since the impedance components change as
> the coax length varies, why doesn't different
mismatch conditions
> occur right at that point?

One value of SWR can be the result of an infinite
combination of impedance's.
And these are just the impedance's you see along the
line. Take, for example, a
(lossless) 50 ohm line terminated in 25 ohms. At the
load, the impedance is 25 +
j0, which calculates to an SWR of 2. 1/8 wave toward
the transmitter, the
impedance is 40 + j30 ohms. This also is an SWR of 2.
(The calculation for
SWR, given a complex
impedance like this, isn't as simple as some people
assume. You can find the
equations in the ARRL handbooks. Notice that this
impedance 40 + j30 has a
magnitude of sqrt((40)^2 + (30)^2) = 50 ohms, but the
SWR is 2.) 1/4 wave from
the antenna or load, the impedance is
resistive again, 100 + j0. SWR = 2. Another 1/8 wave
back (now you're 3/8 wave
from the load), and the impedance is 40 - j30 ohms,
still 2:1 SWR. And 1/2 wave
back from the load it's 25 + j0, right where we
started.

A really great way to visualize this is with a Smith chart. You start with the impedance at the load and go around in a circle, with 360 degrees of circle representing 180 degrees (1/2 wavelength) along the line. All points on a circle on a Smith chart represent the same SWR.

> radio----SWRmeter[A]----------<Antenna
>
> As an example, say the antenna is *not* 50 Ohms (who ever
> really gets their antenna to be 50 Ohm purely resistive, anyway?).
> And the impedance measured at point A is, lets say 59 Ohms.
> If we shorten the coax length like this:
>
> radio-----SWRmeter[A]-----------<Antenna
>
> The impedance at point A would change, wouldn't it?

Yes.

> Wouldn't SWR vary, because of the mismatch at point A?

No. Although the impedance is different, the SWR is the same as before. Remember, given a transmission line impedance, an impedance represents just one possible SWR. But one value of SWR (except for 1:1) can be made from an infinite number of impedances. As it turns out, the impedances that make an SWR of, say, 59/50 ohms are precisely those impedances you find along a 50 ohm line terminated with a 59 ohm resistance.

> Lets assume the SWR meter is good, and has an impedance
> of 50 Ohms.
>
> Or, will the SWR in fact vary? Are there two places
> where standing waves setup (at the antenna feedpoint and
> at point A)?

As you go along a mismatched line, the ratio of voltage to current along the line go up and down (that is, the magnitude of the impedance goes up and down),

and their relative phases change (that is, the phase
angle of the impedance
changes). If the line is at least 1/2 wavelength long,
the SWR is the ratio of the
highest voltage along the line to the lowest. (It's
also equal to the ratio of the
highest current to the lowest.) At any point along the
line, if you look at the
impedance and calculate the SWR, you'll find it to be
the same. (Again providing
that the loss is negligible. If not, the SWR
decreases as you go toward the source.) The standing
waves (these increases
and decreases in voltage and current) are really the
sum of two (or more if you
like) constant-amplitude, constant-phase waves going
in opposite directions.

What you really need to do is read _Reflections_ by
Walt Maxwell, W2DU. It's
currently out of print, but I know Walt is working on
a new edition. I hope it's out soon!

Roy Lewallen, W7EL
ARRL Technical Advisor

In other posts here it is correctly discussed why an SWR meter can vary
with line length - but
it is totally false to say 1/2 wavelength multiples make SWR more true
or improve performance.

BoB.

Source record: 10876

I'm considering getting a Moonracker or similar ie Maco Shooting star beam. Anyone have specs. on either of these ? ie how long the elements are ?, the weight of it ?
Also do these type of beams need a rotor that can adjust the beam angle (azumith) as well as the direction ? And finally any comments or opinions if either one is better than the other.
I'm looking to increase my distance locally, and also want to get into DXing on ssb and 10 meter.
TIA

QRP Hams around. I assume that you would believe Ham operators, as you
do not seem to believe that CBers can tell the truth.

Ask them about how many countries they have worked on 10 meters, running
under 10 watts of power - possibly even less than 1 watt.

Rad shack don't sell crossbows any more.
What they do sell looks alot like the antron99.

(ie) 3 section fiberglass radiator.
Dual tuning rings.
17 1/4 ft tall
2000 watts max

It has a ground plane kit with radials
that are 6 ft long

Sounds like a a99 to me

21-869 for $69.99

and the gpk rsu 12133914 will go for $29.99

Storm (Stormtracker@worldnet.att.net) wrote:
: I'm considering getting a Moonracker or similar ie Maco Shooting star beam.
: Anyone have specs. on either of these ? ie how long the elements are ?, the
: weight of it ?

Both the Moonraker 4 and the Shooting Star have a boom length of about
16 feet. If I recall correctly, the longest element is slightly longer
than 16 feet.

: Also do these type of beams need a rotor that can adjust the beam angle
: (azumith) as well as the direction ? And finally any comments or opinions if
: either one is better than the other.

No, all you need is a direction rotator - unless you plan to work Moonbounce.

: I'm looking to increase my distance locally, and also want to get into DXing
: on ssb and 10 meter.

Get a switchbox and use a vertical for most local communication. It is a
pain to swing the beam for any communications that can be completed using
an omnidirectional antenna.

If you are considering Wilson Antennas, I suggest that you buy them quickly. Wilson Antenna Company is out of business. They sold out to Barjan, and the manufacturing will soon move to China. When it does, the quality will plummet, and so will the performance. Just a note in passing.

Currently I have a Texas Star 667V. I was looking at buying a Storm Built amp and having a variable output, and a receive preamp installed in it. The receive preamp is a 30db variable gain type. The amp itself is a 5 pill, all 2879's. Question is should I buy the Storm and sell the T.S., or can the T.S. be built up to get a comparable output of the Storm? What kind of gain does the preamp in the T.S. have?

Okay Jeff, I read all that Martin has said. How does any of that support anything that you have said in this newsgroup? And how does any of it contradict anything that we have said in this newsgroup?

And, while you're at it, perhaps you should also tell us why Martin's opinions (the opinions that you say supports what you have said) are more valid than any of the other opinions posted in this newsgroup.

Perhaps you should invite Martin to this newsgroup to read some of the messages you have posted. I doubt he would be so friendly afterward.

Toll,
>The 3CX15KB7 would have a hard time holding it's own with a 4CX5000R tube.
I have a 3CX3000A7 and a 3CX2500F3.

I do not have the 3000's data sheet to hand but remember reading the wildly different output power of these two. It's as if Eimac destined two different jobs for them.

What is your professional assessment?

Which one should I keep, which one should I throw?

I only intend keeping one for a long term project as a mobile 'daily driver'.

By the way, while we have these wonderful conditions I intend to trailer out a mobile pump up mast (60ft) that I have together with 5-ele Long John and the Pirate 8-pill that Dennis #12 modded. Should give me a conservative 10KW effective power.

I'd like to attempt to punch a small hole on the bowl. You'll have to let me know what times you listen at weekends. If you carry a mobile phone e-mail the number and I'll ring you from my car when I'm set up.

My mobile will look like Pee Wee's!

>reinforces the type of people I am dealing with. I'd love to try to learn
>something out here but I guess its not going to happen.
My thoughts on this, and I'm no expert is that if you want your amp to
run a higher duty cycle then it of course stands to reason that you need
the power supply to match.

In effect this setup will probably cost you more money in terms of
alternator/battery for any given power output.

It all goes back to the drag race scenario. The Hemi will stay together
for 6 seconds but not 8!

Dave,
It is a 10 meter ham radio. It comes with a 200 watt linear. It is a very sensitive radio. It hears and talks far but is not a good radio for up close use. I mean within a football field or so. Took mine out of the pickup because I couldn't talk to my customers up close. Now if you are looking to talk long distance on 10 meter then this is a good choice. It has a LCD readout.

There might be a 10 Meter person out there that can mod it for you to get that sensitivity down.

Good luck

That statement, put simply, is not true.

I have contacted Moscow before..

How is that possible?

It is "out of skip range" of 11 meters?

What a crock. Skip is skip, is skip.

Their is no magical "range" that 11 meters will not skip too.

> So if I live on a state border, and I start talking, my sound waves
> will cross the state line.

No, the radio waves will.

Does the federal government have the right
> to control my voice?

They are not controlling your voice.

The are controlling the medium of transmission.

Of course, living on the state line, you would be able to scream, and then
in turn, be heard.

However, then the local authorities would have jurisdiction, and they would
bust you for disturbing the peace!

I see your point, but fact is fact.

Toll Free

hi dwight, i sent you proof of contacts from about 30 different countries just because i happen to have those on hand photocopied. as you seen some were from the pacific, others where from africa, and even europe. i think you should know before you sound even more uneducated, there are 340 dxcc countries plus or minus 10 all counted as soveirgn nations by the fcc, dxcc, rsgb, and the arrl therefore i consider them the same way as do all radio operators on the ham bands as well as 11 meters. guess what? people in new york do work china all the time, they just point there beams north and talk over the pole. here you are asking for more proof. how much can you want? you really need to give this one up dwight, but i guess you cant tell when your losing.

now your splitting hairs, sorry if my lingo confused you since your a no-code tech. 1 dxcc = 1 country for all radio purposes. like i said before there are about 340 seperate radio countries. here is a direct link so you can see for yourself, for example if i work tahiti (sent you a copy of that card too) it is considered a totally different country than france for all radio purposes even though its only a french territory. getting it now? check out the link so you can stop posting un informed shit.
http://home.t-online.de/home/IRDX.GERMANY/prefix~1.htm follow this link and youll see what i was trying to say. i have 112 dxcc confirmed and thats a very small number compared to serious dx men in europe. mine would be higher but i stopped collecting qsl's last cycle.

>> I'm sorry, but I do not buy this. As a matter of fact, I know for damn

Currently this cannot be done legally, it would require changes that the FCC put into effect a long time ago, all 40 channel radios have a fixed transmit on SSB and over the years it has gotten harder to make the changes to a radio, so now all manufacturer's will have to redesign their radio's but this can only be done after you get the FCC to allow for this. Was a stupid idea to begin with but what do you expect for the government.

The bottom line, if you're ever "busted" by the FCC for running a 100%
legal station, then I'll listen to you cry foul and consider your
paranoid points. I've never heard of anyone busted by the FCC, who was
running a legal station. They have their hands full as it it is, keeping

up with the radically illegal operators, they're not going to waste their time going after legal ops.

If you are busted for running illegally, then you deserve what you get and I have no sympathy for you.

It's one thing to cry "unfair!" if you are wrongfully prosecuted. But don't promote illegal radio operation, and then try to cry foul when it all blows back in your face.

In the unlikely event that this would happen, why would hams complain?
Most hams follow the rules that they are supposed to follow.

You are once again displaying that persecution complex. Hams are not
hiding behind your bushes, and in your closet, plotting the end of the
CB band. The ARRL is a lobbying voice, that has some pull with the FCC
with respect to HAM RELATED ACTIVITIES, but nothing else. Yes, the ARRL
is made up of all hams, because it is a HAM ORGANIZATION (duh!). The FCC
officials may be made up of some hams as well, as it makes sense that
people who work around radio, tend to enjoy a radio hobby. That does not
mean that they are predisposed to dislike any other service.

CB radio (once again for the slow learners) was never designed to be a
lawless version of ham radio. There are specific rules that are to be
followed. Why should the FCC lend a sympathetic ear to the cause of the
CB band, when a great many of the users, display no desire to follow the
rules of the service? You keep fighting the system from the outside, and
you wonder why you never get anywhere.

If you want to try to rationalize and justify the reasons why you
blatently break the rules of Part 95, then so be it. But don't cry if
you get popped for it. You take your chances....

What Constitutional rights do you have, that are being walked on? The
FCC is a recognized agency, responsible for regulating a natural
resource (the airwaves). Follow the rules, and you have nothing to fear.
Or are you saying that the FCC does not have the right to enforce the
rules that they mandate? Maybe you feel the same about the local police?

Your complaints and constant whining are no different than cable TV
pirates, pornographers, or any other petty criminal, that cries that
their rights have been violated when they get popped for violating the
rules. It's so unfair that they can't be allowed to operate above the
laws that eveyone of the rest of us have to adhere to. so tell me then,
WHAT MAKES YOU SO DARNED SPECIAL?

> >

Right, so now you want an "exclusive" lawless band, so only wealthy
people can ignore part 95.

> it is all of this "air pollution" that causes more problems than all of the
> amps in use today. this is why people feel the need for 100 watts to just get
> across the street in some areas.

Then why do so many of these people keep their amps on 24/7 even when
the band is quiet?

Maybe if the lawless people were removed, the band would be clean again
for the people who the band is intended for.

> a good analogy to this is light pollution that

If every CBer were operating legally, there wouldn't be nearly the
complaints, as the amount of interference from a legal station would be
several db below the high power stations.

Only during peak sun spots or occasional atmospheric conditions. You
cannot reliably talk over 150 miles on a daily basis during the lull
cycle

No, the majority of the lawless types (other than the srict
freebanders), don't like to run sideband, because it is tougher to
operate, and doesn't lend itself well to the "loud and proud" mentality.
SSB is a better mode for a true DXer though.

I understand the problems that are on the CB band (I've been there for
30 years). I understand that there are many people that have "taken the
law into their own hands", in order to be able to enjoy a radio hobby.

But you need to understand that the government is not likely to be sympathetic toward people that openly disregard the rules.

Ham radio is "about" communications. Ham radio is not about "king of the
hill" power contests. You seem to convey a considerable preconception of
ham radio for someone who isn't part of the group.

Power won't help you, if you can't hear anything. Most hams tyry to deal
with noise, through receiver enhancements, such as DSP, notch filters,
adjustable bandpass, and audio filters. Something you won't find on your
$30 CB.

It's true that RF doesn't recognize territorial boundaries. That is why
the ITU exists. There is great pressure for all countries to belong to
the ITU. It benefits all countries to have the protection from
interference, that comes with mutual compatible frequency assignments.

>
> >Secondly, you have an unrealistic view of how hams operate.

> you're running qrp. we don't have this needed luxury.

I'm allowed to run 1500 watts. Guess what? I don't run over 100 watts on HF and 200 on 2 meters. I don't need the hassle, and the TVI problems associated with high power. And I've never had a situation where a station that I was talking to needed me to "crank it up" any more than I already had.

>
> >As if power solves everything. Truth is, most hams don't even own an

> most of us would be happy with that and some of us are.

Many of you "freeband hobbiests" would, in fact be happy with that. But the rest of the "loud and proud" crew, would not be happy with a mere 100 watts, and they would break that rule as well (assuming that the FCC created a 100 watt legal "freeband"). Of course judging from all the negative reactions to strictly SSB-only modes, that may be enough to keep the riff-raff off of the new band. Make it SSB only and you MIGHT make it work.......

The "border jumpers" are relatively new to the 11 meter scene. I never
remembered hearing the sheer amount of Spanish speaking DX back in the
early 80's or in the 70's. I doubt if they were a problem for 11 meters
before CB.

> most other bands.

What?!? 11 meters is virtually identical to 10 meters in DX propagation. And that propagation is dependent on active sunspots to be usefull or frequent. Other ham bands, that are lower in frequency, have much more consistent and predictable DX conditions. When the sunspots are high, you can't beat the DX on 10/11 meters, but when it is low, the DX is not there at all. 20 meters has DX almost any time, as does 40 and 80 meters.

11 meters also had interference from ISM devices that were also assigned to the band. This made the band less desirable than 10 meters.

11 meters was also an oddball in harmonic relation to the other bands. Look at the other ham bands 80 meters is twice 160, 40 is twice 80, 20 twice 40, 15 is 3 times 40, 10 is twice 20. This makes antenna resonances easier to make for multi-band operation, as well as crystal frequency synthesis. 11 meters does not conform to any of these schemes, so special antennas or tuners had to be used, as well as special oscillators for frequency generation.

Then you and your buddies should all get your ham tickets and you'll be 100% legal, and there would be no problem. It will be hard to justify, in the FCC's eyes, the creation of a "mirror" service to ham radio. The only reason that I've seen from you guys against joining ham radio, has to do with some perceived personality stigma, most of which is exaggerated well beyond reality.

> If it's good for you guys it's good for us.

That's where you're wrong. Hams have to take a test to demonstrate that they understand what they are doing (even if the test is administered like a joke). Most CBers wouldn't know the difference between a class C and a class AB1 amp, unless their local "tech" tells them.

> According to the ham test
> study book I have even the no-code tech class hams can run 1500 watts
> on all bands they have rights to if such is needed to get clear comms.

Not entirely true. 10 meter operation is limited to the novice power level of 200 watts.

> I fail to see any difference between that and what the vast majority
> of CBers who use amps do. Contrary to what you obviously think, not
> every amp using CBer runs a "splatter box" as I've seen em called in
> this NG.

You have to distinguish between groups of illegals Cbers. Freebanders, who run a majority of SSB, require and tend to understand the need for

"clean" amps. Freebanders tend to be a bit more knowlegable about such things. On the other hand, the "king of the hill" loud and proud types that run on the regular 40, don't care much if their amps splatter. Class C will usually make a few more watts, and that's all these guys care about. A class C box can also be used as a "modulator" and can enhance (if not completely distort) the "swing" aspect of the modulation. All of this results in adjacent channel splatter, and RFI problems.

The simple fact here is that in the eyes of the FCC, their reckless power operation overshadows the freebanders more conservative application of power, and you all suffer as a result.

> If I look up at my modulation meter and it's going over into
> the red it's time to retune my equipment. I've got neighbors who run
> CB's less than a mile away, and even on the rare occaisions that I run
> max power they never get any bleedover from me. That's because I like
> most amp users, run my equipment clean.

You are not "most amp users". "Most amp users", in my area, run dirty competition class "C" amps with clipped, swing kit installed, garbage radios, and splatter 100 Khz in either direction.

> Stopping all amp usage just
> because some few morons run amps with several 500Z tubes driven so
> hard that they throw purple lightning around inside the glass is just
> as stupid as banning high performance automobiles just because some
> few morons can't seem to control them and keep wrapping them around
> trees or other people.

Bad analogy. A high perfomance car has the potential of injury if wrongly driven, and laws are written to protect the public from the idiots. A "high performance" Cb also has the potential to injure the operator, if misused, and to disrupt the communications of other people. That is why rules were written to address this.

> Facts as far as what was made public. Think about it. It's plain

> been happening between CBers and Hams since 11 meters was allocated
> for CB.

You were right in the period the immediately followed the "taking away" of 11 meters from the hams. There were (and still are) guys that might

never even use a band, but will piss and moan if it's taken from them. It is human nature. However, most of the hams that were active then are either inactive or dead now. Most current hams are not fighting the "incentive licensing"/ "loss of 11 meters" fight any more, except on a few of the geriatric nets.

Many newer hams don't even know that 11 meters was once a ham band.

Has it ever occured to you that the Spanish-speaking DX stations are
just Latin America's version of a lawless Cber? How do you think OUR CB
band sounds to them?

I find it ironic that you bitch about the lack of enforcement of Latino
stations, yet advocate that we (in the states) should be allowed to
ignore the rules.

FWIW, Latin' america's version of the FCC needs to crack down on their
problems as well. But that doesn't excuse us from the same
responsibilities.

So, you refuse to accept data due to a government paranoia, and instead
choose to believe your own "insticts", which have no basis in fact, or
evidence to back it up. When you are diagnosed with brain tumors,
sometime in the future, think back to this thread, and tell us again,
how there is no RF field exposure danger.

Boy, if ignorance is bliss, you must be very happy.....

Oh, we manufacture the electromagnetic spectrum? That's news. We may
make the devices that use the airwaves, but electromagnetic propagation
follow the laws of physics and as such, are natural.

> think about it.
>

Two words. "Implied Consent". In the issuance of the PRIVILEGE to drive as well as operate a radio station, as a condition of license for this PRIVILEGE, you acknowlege that if you are pulled over for an alchohol test (or an inspection of your radio station), as a condition of the granting of the license, you AGREE to allow them to take the test (or inspect). Failure to allow this, invalidates the license, and your PRIVILEGE is revoked.

You can try to Perry Mason the heck out of this all you want, but the rulings stand. If there weren't so many people like you, that try to beat the system at every turn, these laws wouldn't be necessary. What good would a blood alchohol test be if it weren't administered promptly after the violation? Without the blood alchohol test, there would not be sufficient evidence to convict a drunk driver.

Likewise, if an FCC official were denied immediate access to a radio station, the ability to catch an offender, before he's had a chance to "clean up the shack", for the purpose of evidence gathering, would be rendered inneffective.
You want to cripple the actions of law enforcement, so that scofflaws like you can continue to thumb your nose at the rules. The constitution is only a crutch, that you try to swing to try to support your case. The

rest of us can see the real truth clearly though.

It's not a violation of your constitutional rights, since when you sign on the dotted line, you AGREE to it. If you don't agree, then you don't get the license. If you have some weird, far out reason why this implied consent would prove a hardship to you, you can try to apply for a waiver. If you can provide sufficient evidence supporting your case, maybe you'll get it. But you have to try up front, not after a citation.

I have one I use as a driver.. It is a one driving 3 6lq6 amp made by Demco I think?(Toll?). turn it on and warm it up. Start on Slave mode. Flip the amp into operate. Dead key on AM and adjust the Drive ,Tune, Load for max power out. Now modulate your radio with voice or a whistle and retune all the controls for peak power. You should end up with 450 peak from a 100 watt carrier if it works like mine. Master mode is just a high setting. My amp on Master keys up 250 and swings 550. I always run mine on slave(low) as it is much louder and easyer on the amp.

Not another guy that thinks Cranking the AM carrier power adjustment actually helps him! Leave the carrier adjustment alone and turn the AMC up or cut R131 and put the cover back on..

with the front of the radio towards you (component side up ofcourse), it will be on the right side of the board,now start looking in the area of the side closest to you (front-right hand),it is a lil less than half way up the board(from front to back).just look for components near it until you zero in on it,once you find it the first time it will most likely stick in you head were to find it.good luck and 73!

I was thinking of Broadcast band AM stations. The ultimate question is: IS the FCC there for our GOOD, pursuant to Romans 13 OR the 6th plank of the Communist manifesto, or are they an UNConstitutional alphabet soup agency, like the EPA (Gods that our fathers never served or new) , or are they just there to prevent damage (interferance to commercial Babylonian stations, like the 52-890 mhz "Devilvision.") God forbid if CB TVI jamms that TV trash!!!! Dave!!!

My first CB (other than walkie-talkie type) was a Cobra Cam 89, bought in 1975. Ran it with a Starduster antenna and the Radio Shack desktop power microphone - I was going to buy a Turner mic for it, but a guy half a dozen or so houses down the street bought one of the Radio Shack ones, and when I compared the schematics for the Turner I was looking at and the RS one he'd bought, they were identical. The RS one, of course, sold for about $30 less.

73 and good DX'ing,

when i told the news group about having 112 different dxcc countries confirmed a lot of people thought it was un true but its not. a lot of it has to do with knowledge of the band and what countries are where and what mode they use. maybe this list will help others work some of those hard to reach places. this is the most complete and accurate list there is to my knowledge.

2564. low loss antenna- was coax length

Newsgroup: rec.radio.cb
Date: 1999-11-15 00:00:00 UTC
From: Bob <bob-baldwin@tamu.edu>
Message-ID: <383044E9.B052EDD4@tamu.edu>
Source record: 10949

Ok, first things first- I had to read the jokes posted by Cold as Ice.
Next-- I will sign my full name (several bobs here).
Now for the antenna. Everyone has guessed by now that it has to be a wire antenna to be cheap. It is a simple dipole configuration using 450 ohm ladder line, no transformer, and normally, no tuner. I didn't intend to say or imply that the transmission line tunes the antenna itself, but rather, the antenna *system*. The SWR at the feedpoint will remain constant at a given frequency (and will probably be high). It can be strung up in normal dipole fashion, vertical or inverted "V". This antenna is low loss, meaning that it will radiate a high percentage of the power supplied by your station. The neat thing about it is that you can feed low loss 450 ohm line with a 50 ohm system without the need to transform impedances. All that is required is a 1:1 choke balun (no transformer or impedance matching loss) to couple coax to balanced line. Of course, a tuner can be used if you want, but it will introduce some loss. The length of transmission line directly affects the resonance of the system. The dipole length can be 1/2 wavelength or longer.

All that is required is:

-- enough wire for the dipole + insulators almost free at Radio Shack
-- a roll of 450 ohm ladder line AES summer 99 lists 100' 18ga for $12.95
-- W2DU 1:1 non-transformer choke balun " " " " the HF model for $26.95
-- coax from balun to station to connect the balun to the radio
-- Ladder-Loc (optional) secures the 450 ohm line to the dipole-- $12.95

This antenna works very well, and is great for radio operators wishing to build/experiment with antennas. It is especially good when long runs of transmission line are necessary. It will not be practical for everyone. The HF balun works from 1.8 to 30 MHz. The VHF model works from 30 to 250 MHz.

The drawbacks are:
-- How to string the thing up with the line coming away at 90 degrees
-- Wet weather will affect the resonant frequency and will require changing transmission line length- or by using a tuner till things dry up.

For details, see Cecil's (W6RCA) web site
http://www.bigfoot.com/~w6rca
Select W6RCA's No-Tuner All-HF-Band Antenna

His basic program will calculate the length of ladder line needed to find the low impedance/high current points necessary to feed a 450 ohm system with 50 ohms. Pick a convenient length from those available, add some to be safe, and then start cutting back to resonate where desired. One length should work for all 40 cb channels in dry weather.

I didn't proofread this, so please excuse my speling.
I hope that I didn't miss anything- let me know if I can help.....

Hey, you have the same catalog I have. :-)

Actually, it is the Solarcon A99 - right down to the stickers on the
base to the yellow tip on the top. I wonder if Radio Shack left the
Solarcon sticker on, or replaced it with their own sticker.

And the price is not too bad either - about the price of the A-99 from
most mail order sources with shipping added.

Source record: 10957

>Toll,
>>The 3CX15KB7 would have a >>hard time holding it's own with a >>4CX5000R tube.

Keep in mind that a 3CX15000B7 tube was built for efficiency and low operating cost. They are used in 30KW FM transmitters everyday of the week 24hrs/7 days a week. A 3CX15000A7, or any other directly heated cathode tube requires very much drive power and mega filament current. The A7 requires 100 amps of filament current where the B7 only requires 15 amps. The A7 also requires 1KW or more of drive power for full output where the B7 only requires 400 watts. This saves on operating cost and the hardware required to drive the amp. The directly heated cathode tubes are a good choice for a rugged tube that can take a bit more abuse but it is costly to drive and to heat the cathode requiring much more current. They are probably used by many of the CB amp builders because they are less expensive, and are more forgiving in poorly designed RF decks using sub-standard parts. Either way any of the large Eimac (now owned by CPI) ceramics are a good bet to go with and will do big CB power. You might use cost and availablity for your overall determining factor. I like the 3CX3000 because they are cheap, can take a beating, and will do 10KW. They work great on the lower ham bands but the problem on CB/10 meters is they are prone to VHF parasitics and if they are not tamed will cause premature failure due to cathode/grid sputtering. This is when the VHF/UHF parasitic causes the cathode to over heat and some of the trace elements (gold&BY if I remeber correctly) boil and become airborne and cause a cathode to grid short. The easiest way to fix this problem is to build a good parasitic suppressor at the frequency of the parasitic and swamp the input. Most dont swamp the input because the inefficient directly heated cathode tubes require so much drive already that they dont want to loose any drive power in the swamping network. Many amp builders sum up tube failure to operator error or beating the tube beyond specs but parasitics are the #1 reason of ceramic tube failure. A quick way to check your amp for a parasitic oscillation is to get a long plastic stick and attach a neon lamp to the end of it. Carefully key up your amp with the top cover off and bring the neon lamp close to some of the parts, suppressor, plate cap, tank circuit, DC blocking cap, Plate choke,etc.
The neon lamp should light up orange in the presence of HF energy-this is normal. If it lights up purple or blue you have VHF/UHF energy in the tank circuit. You will normally see a little of this in the parasitc suppressor but a properly designed amp will not have this anywhere else. If you find a parasitic you should detrmine the frequency and rewind your suppressor for that frequency. Be careful when doing any of this because you are dealing with LETHAL and DEADLY DC and RF Voltages. If you are not qualified to do this or even feel a little reluctant to- DONT! (thats the standard disclaimer just in case any of you guys try this and vapor lock in the process) Have fun amp building!

Jim

> Keep in mind that a 3CX15000B7 tube was built for efficiency and low
operating
> cost.

They where also built for a 15Kw transmitter... Nothing more.

Look at the specs.

Do the math.

They can't hold their own with the "other" triodes of equal dissipation.

They are used in 30KW FM transmitters everyday of the week 24hrs/7 days a
> week

Name one commercial (Harris, Gates, Collins, Henry) 30Kw transmitter using
the 3CX15000B7 tube?

The other tubes of 15Kw dissipation will do it, but the B7 tube is only
going to give you 15Kw output! At least, operated within ratings!

That, and the grid doesn't have the dissipation necessary to get the drive
level up high enough.

And, the cathode doesn't have enough emission capability to do 30 grand!
Their is a reason that the other 15Kw tubes have 100A on the filament!

. A 3CX15000A7, or any other directly heated cathode tube requires very
> much drive power and mega filament current. The A7 requires 100 amps of
> filament current where the B7 only requires 15 amps.

Because at 14.?? Kilowatts of output (which is what it is rated at), the fil
/ cathode doesn't need to give off that many electrons.

The A7 also requires 1KW
> or more of drive power for full output where the B7 only requires 400
watts.

It takes half the power input because it is outputting half the power!

> This saves on operating cost and the hardware required to drive the amp.

Agreed... And 15Kw is nothing to sneeze at!

The
> directly heated cathode tubes are a good choice for a rugged tube that can
take

might use
> cost and availablity for your overall determining factor.

The BIGGEST reason people are running the 3CX3K tubes is because of their availability on the surplus market.

If the CB amp craze continues, keep looking and you will find the 3CX2500 tube being sold. It is starting to hit the surplus (medical pulls) market, and has the same dissipation on the plate, but a somewhat lighter grid.

I like the 3CX3000
> because they are cheap, can take a beating, and will do 10KW. They work
great
> on the lower ham bands but the problem on CB/10 meters is they are prone

Easily handled by simple tricks like Nichrome wire in the plate leads, decent straps and other things.

This is when the VHF/UHF parasitic causes the cathode
> to over heat and some of the trace elements (gold&BY if I remeber
correctly)
> boil and become airborne and cause a cathode to grid short.

This was the problem with the "bad" runs of the 8877 tube in the 80s and early 90s.

I, among many, never got over it, and we shy away from the 8877 tube.

The easiest way to
> fix this problem is to build a good parasitic suppressor at the frequency
of
> the parasitic and swamp the input. Most dont swamp the input because the
> inefficient directly heated cathode tubes require so much drive already
that
> they dont want to loose any drive power in the swamping network

Actually, they don't want to do this for other reasons, as well.

Most of the CB amp builders consider the "extra" thousand watts of feedthrough / overdrive / whatever you want to call it necessary because of the "watt wars" that they must fight in order to stay in business.

If you lower the drive from a 3CX3K tube from 1500 watts to 750 watts, you only loose slightly over 1500 watts of output...

And you drop the drive in half!

Figure that out.

Overdrive, harmonics and feedthrough power!

. Many amp
> builders sum up tube failure to operator error or beating the tube beyond
specs
> but parasitics are the #1 reason of ceramic tube failure.

Sounds like you like Richy Measures!

Why would you want to"get that sensitivity down"? Selectivity and
sensitivity are 2 different things,they can interact with each other but
you want both to be as good as possible.
You run a shop,you should know that.

Any antenna intended for the band(10 or 11?)should work,I prefer Yagi
type beams the longer the better.Used ham tribanders work great
especially the good strong ones like a TH6DXX or a KT34XA

Tim, I know there are some big radios in Texas everything is big there but realisticaly I don't think 32 pills are used for drivers since lots of the guys are in base stations, and almost nothing would require that much drive and if it somehow did they would be better of using an ac driver with 1 alternator rather than a 32 pill with 3 or more alternators and a load full of batteries. plus the driver for the 32 pill and the alternator to run that.

Tim <zeroeightytwo@aol.come> wrote in message :

You need an VSWR (SWR)meter then you can check your ant from the shack end of the coax.the short/open thing you did will give you different readings with different antennas 1/4,5/8,etc.
I doubt the thing was hit by lightning or it probably wouldn't be there.

WRONG! You only get 3 DB MAX when stacking,you don't get to add the gain
from the 2 antennas..too bad
Example 15 DB beam + another 15 DB beam nets you 18DB.
Yes I run 2 15.2 DBI beams,not on 11,I wish!

Radials should raise the Q of the antenna which will reduce bandwidth.

> #3 lowers angle of radiation

Nope. The takeoff angle of a vertical antenna is determined by ground
conditions extending far beyond the length of the radials.

> #4 effectively reduces interference to other services
> in the local area or near field

Huh?

> #5 increases the gain of the array

That's possible, however, that is done by increasing the Q of the
antenna hence better efficiency.

12 volt gel cell batteries for sale. Used but all load tested good. 30 day guarantee !!! Removed from burglar/fire alarm systems and replaced every 3-5 years with new ones as preventative maintenance for our customers. I have sold hundreds of these to the QRP boys on the QRP-L. I will stand behind every one sold 100% ! Prices listed INCLUDE shipping via UPS to your door.

12 volt 4AH --- $10
12 volt 6AH --- $12
12 volt 7AH --- $13

I have only a few 4's and 6's and about 36 of the 7's. Brands are mixed: Yuasa, Interstate, Portalac, Radionics, Power Patrol, MK Battery, Batteries Plus, Power Sonic and a couple of other brands. I do not and will not sell Panasonic brand as they have proven themselves to be total junk. Please email me with quantity desired and your zip code.

Welcome to the discussion, Martin. I understand what you are trying
to say, but I must point out that all of this has been covered over and
over in this newsgroup. We have discussed the legal establishment of
the FCC. We have discussed the ITU.

We have discussed the reasons behind the rules. We have discussed the
negative effects of illegal equipment. We have discussed the negative
effects to other radio services. We have discussed the negative effects
to other CB operators. We have even discussed the negative effect all
this has on the image of CB radio. And we have discussed alternatives

to illegal operation.

And I should also point out that this is not just the position of the ham operators in this newsgroup (by the way, we are also active CB'ers - not just ham operators). Many non-ham Cb'ers have also argued with Jeff about these very same issues. Jeff has just centered on the few ham operators here in an effort to split his opposition and thereby strengthen his side of the discussion.

You are entering this debate after weeks of discussion back and forth. In the beginning, the debate was as polite as you advocate. However, after weeks of mudslinging (on both sides), the debate has become somewhat heated.

It is at this point that Jeff decided to invite you into the discussion. I'm sure Jeff has described himself as the poor victum of trolling ham operators out to pick on him (he has done this in the newsgroup many times). However, if you read over some of his past messages, you will quickly see that he has given as much as he has got.

You state that we should point out the violations privately and respectfully. However, when public statements are made, the only way to address those statements is to use the same public forum. And respect has to go both ways.

So Martin, the only thing you are right about is the futility of continued debate with Jeff. But, I must also point out that we are not just addressing Jeff in this public discussion - we are also addressing the countless people who may be reading Jeff's messages. Perhaps we cannot change Jeff's mind, but we might present an argument that will convince others.

However, I'm more than willing to drop the discussion if Jeff is. In fact, I've offered to do so many times. But, if he wants to continue his assault on the ham radio operators in this newsgroup (such as he did when HE USED YOU to try to support his claim that we have an ""RF police, holier than thou, "because I said so" attitude."), then I feel obligated to respond.

> #1 provides a better match

That's possible

> #2 provides additional bandwidth

Radials should raise the Q of the antenna which will reduce bandwidth.
Wrong! adding the
gpk-1 radial kit improves bandwidth.....do the tests!

> #3 lowers angle of radiation

Nope. The takeoff angle of a vertical antenna is determined by ground
conditions extending far beyond the length of the radials. Wrong!
The radials lower the angle of radiation regardless of the height
above ground, however, the lowered angle can be enhanced by using
a good ground system as well as making sure that the feedpoint is
at least one wavelength or any multiple of whole wavelengths above
ground

> #4 effectively reduces interference to other services
> in the local area or near field

Huh? Yeah, you know! like television and telephone interference!

> #5 increases the gain of the array

That's possible, however, that is done by increasing the Q of the
antenna hence better efficiency. Wrong! See #2

Sorry Tracy,

We're not talking about beam antenna, we're
talking vertically polarized colinear arrays.
You of all people should know better than this!
Just go look at the colinear designs that they
use for vhf and uhf stations and repeaters....
There are vhf and uhf vertical colinear arrays
in the 9 - 15 db gain region and beyond. The same
type of design applies to the antron 99. If you
want to compare apples, well then let's compare
apples and leave the rest of the fruit out of
discussion!

Jack

http://www.angelfire.com/az/firecommunications/

The addition of the gpk-1 changes the A-99 from
a 1/2 wave over a 1/4 wave to a 1/2 wave over a
1/2 wave........the physically shortened radials
are loaded 1/4 wave elements. The gain is still
somewhere between 7 and 9 db .

No one way would be a 6 port combiner and the other a 3 port combiner. the 6 port would be used when there are 2 pill stages where each 2 pill output imp is 50 ohms then they are all combined with the 6 port and a LC network, or the 3 port com would be used when 3 - 4 pill stage outputs are combined into a 3 port then into the LC network. Then there is the old days when 5 turns were used and 6 pills were fed into one 3 port and the other 6 went into another 3 port combiners, which then was combined and tuned at this point.

Hi,

Does anyone have the mic pinout for the Eagle sidewinder?
I really hate the original mike and intend on wiring one of my own.
TIA

T.W.

Jack what have you been smoking, 9.9 dbi gain. Anyhow after a certain heigth above ground the radilas make very very little differance, the associated ground losses are not there after you go up more than 36 ft for 11 meters.

Get out your ARRL books you will see 85 ft in the air for an 11 meter vertical antenna the ground radials will probably not show any differance.

My DX-440 SW receiver has an IF filter with narrow and wide modes.
On narrow it filters out everything beyond 3 KHz. If I tune an AM
station and tune away 3 KHz, it sounds like bleedover. When I put
it back on wide mode, I can hear the high frequencies better because
the part of the signal with the higher frequencies is now is the
receiver's passband.

Dwight,
The big question that the news group usually keeps mulling over is the
legality of FCC rules and their enforcement, Jeff and myself have
discussed the following:

1. Right to Inspect: Yes the rules (CFR 47 part 95 and 97 state you
MUST allow inspection but the law is only directory, not mandatory.
That means, if you do not allow inspection, the 2 recourses allowed the
FCC are:
A. Monetary Fine (NAL for lack of candor)
B. Warrant in which Mr. FCC brings along some of his Federal and
State LEO friends (aka 3 letter agencies).
2. What is the ITU, what about the code requirement and why does each
and every country of the world subscribe to the ITU.
3. Linears are they legal (read Part 95 and 97), their use and
enforcement.

The major thing is to learn the why fore and becauses inorder to explain
the reasons behind any rule. People don't want "I told you so" answers,
research is the key to presenting persasive debate so read the rules,

study the laws and their application and always ask questions. As newbie to newsgroups, I want to emphazize you do not want to be relegated to TROLL status and something else which needs to be said, those persons who wish to do as they please must suffer their own consequences, I can not make myself miserable over those who wish to operate linears, freeband, out of band etc. The proper method is to point out, PRIVATELY and RESPSCTFULLY, the violation and if the person doesn't see the error of his or her ways, then you have done all that is in YOUR POWER to do, they must learn to suffer their consequences.

The main conerstone to radio is polite operations, we want people to be curious about Amateur Radio and CB, not revolted by it.

Hi there,

Recently I attached an old (& cheap) CB base station to the antenna on top of the tower at our cabin (we inherited tower & antenna from previous owner). The tower is about 85' high, and the antenna is about

13-14' high (??) fibreglass pole, with 4 horizontal radials (each about same size as the antenna) at the base of it (up at top of tower). The antenna did work somewhat, I could talk to my mobile CB and back for a distance of 2-3 miles, with varying degrees of clarity. But sometimes talk was barely understandable at 2 miles. The terrain is flat & wooded, cabin is on a slight hill on lakeside.

The antenna has been up since the mid 70's, and I know for a fact that it has been hit by lightning several times. When checked with a multimeter, there is no resistance between the center conductor of the coax and the coax shielding (I was replacing the connector on the bottom). So, (here is where I start guessing), I think that the radials should be connected to the shield of the coax (true?) and the antenna should be connected to the core of the coax, and that there should be some resistance between them (?). Does the lack of resistance mean that something has been cooked & shorted up top because of a lightning strike? Do you think the performance would improve dramatically by replacing the antenna? I am thinking that the antenna is probably cooked and that maybe when I attach it to a CB, it sort of works, but might be having pathetic performance limiting my range (despite the fact that this tower is TALL). Of course the old, cheapo base station might not be helping either, but I can't really tell that until I get another unit to test (I can use another mobile on base antenna and see if things are any better).

Is there a way to determine whether a CB base antenna is in good working order, including the radials? (especially without having to take it down)

Thanks in advance for your $.02

Brent

Wow, antenna, did anyone ever try one of those back of the set antenna? I had a big stick for my forst antenns, but when I wanted to move my radio to my bed at night, I would put a back of the set I got from radio shack, and it worked great for local people. Then I had a 3 element beam, but a storm took it down, so I finally ended up with a 5/8 th wave which was great!... I mss my CB days. Haven't been on for a while myself, but this newsgroup has me thinking about a SSB mobile, but yes I am a h__ and talk on there too, but who says you can't go back from time to time?

Hiya,

This is a followup on my long post about testing a cb base antenna. If/when I replace with another (for example an Antron 99) should I bother getting the kit for adding radials up there? The guy at the shop I spoke to thought there shouldn't be much need for them on an 85' tower. What is their advantage? I'm interested in the best range for local communication with mobiles and HT's, not DXing if that makes any difference.

thanks,

Brent

I have a like new, 3 week old, 3 element beam antenna,
the M-103C by Maco, for sale. I'm selling this due to the
fact that I cannot install this antenna at my present
location. Thought I could, for many reasons cannot. I
also cannot return it from where I purchased it due to
the fact that the box was opened. The antenna has NEVER
been assembled and has all of the original UNOPENED hardware.
It also of course has the installation manual. This antenna
sells for around $100 new plus shipping.

For more info please click here:
http://www.majestic-comm.com/maco/products/antenna/m103c.htm

I'm selling it for $85 which includes shipping via UPS oversize.

A ham, huh? Let me add my 2 cents. I live and play in Tampa Bay. I have over a hundred countries myself(ALL contacts made between 25 and 27.995) with the cards to prove it. So I know 112 countries is not only possible, it is probable. I don't have a beam, only a Maco 5/8 GP about 46 foot in the air. The most power I have run is 100 watts(which is VERY rare, only to get a QSO card from a rare or exotic locale) and most were made with 12 whiskey out on the side. I do know that the amount of water that surrounds my state plays a part, but I am a driver who routinely talks DX from my mobile rig out of state and country when I am on the road. Get with a free-bander who knows his stuff. Sounds like the guy with 112 countries can teach you a thing or two about propagation!!!

The radials on a ground plane antenna are needed to provide a counterpoise
for the driven element. Since the A99 is nothing more than a 1/2 wave
vertical dipole, the counterpoise is already inside the antenna. The radial
kit they sell for it is a way to make a quick buck from the CB crowd.

I would like an honest opinion on the center loaded trucker antenna from K40. Is it as good a performer as the base loaded K40 with the same low SWR characteristics? And yes, I've tried the Wilson 2000 and didn't like it.

Dan,

Careful Dan, Antron claimed the antenna is co-linear -
a 1/2 wave over a 1/4 wave antenna.....so, in this case,
are radials needed? They correctly slant down at 45 degrees -
to bring the radiation resistance up from 36 to 50 Ohms
like the typical ground plane antenna.....but, why are they only
6 feet long? One must wonder......

The B.O.B.

The Antron 99 is not a half wave antenna!
(Another myth destroyed)

You saw it, you looked at it, it was about 18 feet long, and right off the
bat you decided, "It's a half wave antenna".......Well, you're wrong again!

The Antron 99 is a loaded 1/2 wave over a loaded 1/4 wave, variable mutual
transductance tuned vertical antenna! "Anyone who had read the advertising
would know this"!

The term colinear simply means "in a straight line". Any antenna using 2
or more discrete elements stacked one above the other, is a colinear array.
To be exact, it is a 2 element stacked colinear array for the 10 and 11
meter bands! Put it together and place the feedpoint at 37 feet above
the ground, (which is approximately one wavelength at 27 mhz) and don't
forget to connect the other end of the feed to the "base". Pick up the
ground plane kit for it later on as this is a worthwhile addition! Besides
decoupling the antenna from the feedline and optimizing the input impedance
the ground plane kit will also help further reduce rf interference and TVI
in the near field of the antenna.

The Antron 99 is a half wave over a quarter wave variable mutual
transconductance tuned antenna. When you add the ground plane kit it becomes
a true colinear antenna. During the last several months, with the exception
of days of high solar x-ray activity, I have maintained semi-consistent
contact with several stations in Australia using an HR-2510 running 40 watts
on ssb with an A-99 with a feedpoint height of approximately 74 feet.
(92 feet to the tip)
A simple 1/2 wave colinear array consists of two halfwave antennas, one
stacked above the other. When you add the ground plane kit to the basic

99,
this is what you end up with.
Many have disputed this, and usually because:

#1 They see it is 18 feet long and assume it is
a halfwave antenna based on physical size.

#2 They have simply never read the advertising.

#3 They have never seen the inside of the A-99.

And you know what? That advertised figure of 9.9dbi. (i=isotropic
source
/very few people know what this is) isn't that far off. Subtract a
couple
tenths of a db. from each of two loaded halfwave antennas then add 3db.
for
stacking and you'll see that this figure is fairly accurate.

Example top loaded halfwave = 3.0 db.
*bottom loaded halfwave = 3.0 db.
gain from stacking = 3.0 db.

Total gain = 9.0 db.

* includes ground plane kit

Actually, not really. While you can have a station on USB, while another runs on LSB, all is fine until the signals get REAL strong, then there is bleedover, just like we have now. As long as you aren't over s9+, thee won't be a problem, but if you are in town with locals that run +20 over, you'd be wise to avoid the adjacent sideband.

Of course, with a slightly narrower filter (About 1.9 Khz), much of that interference could be minimized, at the expense of audio fidelity.

Brent and the ng,

The bottom half of the A-99 is a quarter wave element. Quarter wave antennas require a radial system for all the reasons previously mentioned!

With the addition of the radial system the A-99 becomes a true 1/2 wave colinear antenna.

Nothing any of you have to say will change that!

Jack

http://www.angelfire.com/az/firecommunications/

Well Dave, maybe that explains all the horrible rules on the business bands. Or the radio regulations placed on commercial aricraft. Those guys at the FCC are a bunch of ham operators and are out to get everyone else. ;-)

You know, considering the popularity of CB over the years, it would not be too much of a stretch to image that at least several of the FCC heads (past and present) were once CB users. In fact, it would be rather surprising if they weren't.

Anyway, I have not seen any negative attitudes towards CB by the officials at the FCC. I have seen a demand that the rules be obeyed, and I have seen enforcement actions taken against those who did not obey the rules. But, I have not seen CB treated any differently than the other radio services.

Hi Jack,

Relax...breath in, breath out.

I never said it was a 1/2 wave antenna.

I am kinda tired of arguing things on here, you know?

However, you screwed up your gain numbers totally, though.

Thankfully, Solarcon NO LONGER claims that gain figure - they
dropped in down to 3 dbi --- which is the absolute truth.

I am sure you sell these miracle antennas and tell all
your customers it has more gain than a 4 element
yagi!!!! Amazing!!!! Come on Jack, do you honestly
believe this has more gain than a 4 element beam?
More than a 3 or even a 2 element yagi?

A *loaded* 1/2 wave vertical antenna has about
2 dbi worth of gain, a loaded 1/4 wave antenna has
practically no gain ~ 1 dbi.

True, stacking increasing gain by 3db, but Jack, the
pattern of these two antennas are so tightly coupled
(they are too close to one another) that you see
no increase in gain from stacking. You
rely on the spec sheet for all your knowledge?

Why do you say 3db worth of gain for the 1/2 wave, add another 3 db for
a ground plane antenna, then add 3 db for stacking?
Thats not even how you calculate additional gain from stacking!

Say both antennas somehow had 3 db of gain, stacking them
only puts your gain up to 6 db (NOT 9, 3db + 3db +3 db)

But this is neither here, nor there, the A99 has the same
gain as a 1/2 wave vertical - but has the advantage
of wider bandwidth.

The radials are a gimmick - why do you think they are 6 feet
long? It is cheaper to just re-use the top sections rather than
endure the cost of making another fiberglass piece.

For the sake of more business, argue this until you fall over
dead.

BoB.

Brent,

Well, there you go! I can tell you this,
regardless of all the tech "headbumping"...
I maintain 'round the clock schedules
with stations in Flagstaff, about 100 miles
west of here and a fairly regular schedule
with 2 stations in Australia running 40 w.
lsb. If this is what you're looking for,
then the ground plane kit would be a worthy
addition, again for the reasons listed below:

#1 provides a better match
#2 provides additional bandwidth
#3 lowers angle of radiation
#4 effectively reduces interference to other services
in the local area or near field
#5 increases the gain of the array

If you have any further questions, email me at:

fire228@cybertrails.com

Radio Shack does not carry the Crossbow anymore. In fact, they
currently carry the Solacon A99 in their catalog (the Antron 99). Item
number 21-869.

Oh, jeff, there is an appeal route from the civil forfieture rules and
to even the Federal Court system under civil rules.

> > it's a word game that they play that circumvents your civil rights.

> > they know that the triangulation coordanances, the key signature and voice
> > print technology would be weak in a criminal court

The evidence you stated would be acceptable due to expert witness rules
in the Federal Court System. The FBI uses the samre technology to
track "bugged" items and they even use "amateur" Fox-hound equipment
which the amateurs developed. (See dopsys.com and joe moell's (k0ov)
website which I think is http://members.aol.com/homingin)

so the take it into the
> > civil court arena where the preponderance of the evidence rules arn't so

GOOD THING, it would hate to see the FCC turned into an Bureau ATF with
full metaljacket type powers. The FCC was designed to be a regulatory
agency in 1934 (FRC, Federal Radio Commission before that was a Dept of
Commerce Organization with US Navy and FBI doing Radio Investigation),
not a Law Enforcement Agency.
>

The 26-27mhz region is lused in several Latin American Countries as a
"Business band" with high power limits, FM, Amps etc., the licensing
authorities of most South and Central American Countries are very strict
about their licensing and deal harshly with violators, on the other
hand, high power licensing is the Norm there.

> > > Secondly, you have an unrealistic view of how hams operate.

Can someone please answer this for me. I set my base station back up again with little room to work. Will I run into any problems if my radio and amp are to close to my power supply? I don't mean an electrical problem I am referring to an RF problem. I have keyed it up and have not detected anything so far. Other then coming though every channel on my TV's ...lol. I would really like some help on this matter.
Thank you,

Gunsmoke <<AKA>> Mr.. Double

So then,

The two port based amplifiers (2, 4, 8, 16, 32) don't use the same splitters
and combiners the odd amps (6, 12, 24, 48) use then, do they.

Seems to me that is what I said in the first place.

I am interested in getting either the Maco or the Imax. I was wondering what everyone experienced with these two models. I am looking for a good rugged antenna to replace my A99 which is WAY too dirty for my area because of the closeness of my neighbors. Also, I am open to other suggestions on vertical antennas that won't take out the surrounding houses' tvs, stereos and phones.

Thanks in advance and 73s

Mudpuppy

2684. Re: Conflicting stories of Mods for the 148 GTL - ST

Newsgroup: rec.radio.cb
Date: 1999-11-15 00:00:00 UTC
From: Hank Aaron <REMOVEjeffherrings@hotmail.com>
Message-ID: <80qid2$be1$1@nntp6.atl.mindspring.net>
Source record: 11069

These steps should be absolutely taken before using "common" found mods for the Cobra 148 GTL.

Remove C35 and C16. Short pins 3-(red wire) and 5 (yellow wire) of the connector on the channel selector PCB.

I have found by study that this is the most direct way (while best sounding) of smashing ST more less.

Hank

Do they seem to be the same quality? Do they take to tuning the same? RX or TX any different?

Scott,

This is much better!

Jack

POWER TWEAKS:
Re-tune coils L37 and L38 for maximum forward swing on AM mode.

MODULATION: Replace R131 with a 1.4 megohm, quarter watt resistor
AM POWER: VR10 (Do not exceed 4 watts carrier, 1.5 watts for amp)
SSB POWER: VR11 (Adjust for minimum distortion, 3/4 to full on)

TYPICAL OUTPUT:
AM: 18 - 25 watts pep
SSB: 25 - 30 watts pep

******

I hear literally several hundred stations
every day on 38 lsb who have absolutely no
problem talking to anyone on the frequency!
This usually occurs because of inadvertant
"twisting and twiddling" with the ssb tx
and rcve offsets, usually unknowingly by
well meaning technicians who are unaware
that their "playing around" can create some
frustrating problems. Very few shops are
equipped to handle adjustments of this nature!
After you and another operator have "chased
each other around the dial" a few times, you
know what you have to do!

Jack

>> Keep in mind that a 3CX15000B7 tube was built for efficiency and low
>operating
>> cost.
>
>They where also built for a 15Kw transmitter... Nothing more.

>Look at the specs.
>
>Do the math.

I should have qualified my answer a little better- WMMR in Philadelphia runs a par of B7's in Class C FM service. In 24 hour a day service it is a very effiecient tube to run in comparison to a directly heated cathode tube (the B7)

>
>They can't hold their own with the "other" triodes of equal dissipation.

I agree on output power- but efficency and low drive power was the design parameter- not raw power output.
Thats why they are used in broadcast service- electric does cost money when the xmitter is always keyed. I dont think we worry about the electric meter too much for the short period of time we transmit. It also would be a good tube for mobile use. 15 amps of filament current is alot less than 100. If raw power output was the only objective i'd run (2) B7's instead of (1) A7. You would get the same output with less filament current, less drive and actually have a little more room for error. Before you say it... I agree that (2) tubes would be costly.

> They are used in 30KW FM transmitters everyday of the week 24hrs/7 days a
>> week
>
>
>Name one commercial (Harris, Gates, Collins, Henry) 30Kw transmitter using
>the 3CX15000B7 tube?

WMMR runs an Omnitronix Broadcast C30K, and Scientific radio also made a 15KW SSB amp for military use (not broadcast) that had a solid state driver driving a 3by15B7. They also made a 5KW using the 3CX5000B7. I dont know the model #'s of the SR stuff.

Some of the other tubes of 15Kw dissipation will do it, but the B7 tube is only
>going to give you 15Kw output! At least, operated within ratings!

When do you CB guys ever run anything within their ratings?!!!!
:)

>That, and the grid doesn't have the dissipation necessary to get the drive
>level up high enough.
>
>And, the cathode doesn't have enough emission capability to do 30 grand!

Actually the close proximity of the cathode to the control grid helps this, it wont do 30 grand, but it also only requires one seventh the filament current (directly related to cathode emission) to do half the power. Not a bad trade off and very helpful in some applications. (Efficiency again)

>Their is a reason that the other 15Kw tubes have 100A on the filament!

Yup!

>. A 3CX15000A7, or any other directly heated cathode tube requires very
>> much drive power and mega filament current. The A7 requires 100 amps of
>> filament current where the B7 only requires 15 amps.
>
>
>Because at 14.?? Kilowatts of output (which is what it is rated at), the fil
>/ cathode doesn't need to give off that many electrons.

Equal Drive power, Plate Voltage and Plate Current, Both tubes will do about the same out (at 15KW), but the B7 will still do it more efficiently. No need to dissapate a KW of filament current, especially if you go mobile.

> The A7 also requires 1KW
>> or more of drive power for full output where the B7 only requires 400
>watts.
>
>It takes half the power input because it is outputting half the power!

Not exactly half- 40% which is still more efficent.
>
>
>> This saves on operating cost and the hardware required to drive the amp.
>
>Agreed... And 15Kw is nothing to sneeze at!
>
>
>The
>> directly heated cathode tubes are a good choice for a rugged tube that can

>> decks using sub-standard parts. Either way any of the large Eimac (now
>owned by
>> CPI) ceramics are a good bet to go with and will do big CB power. You
>might use
>> cost and availablity for your overall determining factor.

I think that paragraph sums it all up- You should make your decision depending upon cost, availability, and required power output. B7's are evrywhere and can be had for Cheap but run whatever you can get! Another cost factor should be factored into reliabilty. I know this dude running (8) 3-500Z's and getting a rediculous amount of power out of them but he blows them every 3 months. He could just run one 3CX3000, do more power, and its still cheaper in the long run.
Too many guys out here are penny wise/dollar foolish. A good expensive tube can be much less expensive in the long run than a bunch of cheap tubes.

>the BIGGEST reason people are running the 3CX3K tubes is because of their
>availability on the surplus market.
>

And they are cheap as hell, just bought a brand new CPI 3CX3000 for $729

>If the CB amp craze continues, keep looking and you will find the 3CX2500
>tube being sold. It is starting to hit the surplus (medical pulls) market,
>and has the same dissipation on the plate, but a somewhat lighter grid.

I'd rather have the 3by3 in the long run- goes back to the penny-wise/dollar foolish theory. Spend a couple more bucks for the reliabiltiy.

> I like the 3CX3000
>> because they are cheap, can take a beating, and will do 10KW. They work
>great
>> on the lower ham bands but the problem on CB/10 meters is they are prone

>

Easily handled by those who know- but unfortunatly alot of the stuff out there does not have it!

> This is when the VHF/UHF parasitic causes the cathode
>> to over heat and some of the trace elements (gold&BY if I remeber
>correctly)
>> boil and become airborne and cause a cathode to grid short.
>
>This was the problem with the "bad" runs of the 8877 tube in the 80s and
>early 90s.
>
>I, among many, never got over it, and we shy away from the 8877 tube.
>

Its actually a problem with any ceramic that encounters a parasitic, but the 8877 was especially sensitive to it because of the close proximity of the grid and cathode. (one of the main reasons it is such an effiecient tube)
>
> The easiest way to

>> fix this problem is to build a good parasitic suppressor at the frequency

"Jeff,
the interconnection between countries on ANY type of telcommunications is overseen by the ITU, The ITU was founded in 1859 to standardize telegraph connections between European countries as to allow for the rapid passing of traffic or messages. With invention of Telephone and radio, the ITU assumed duties in regards with the Cairo Conferance of 1906 which set up an international standards committee which came up with the phonetic allocation scheme (K,N, and W along with AA to AK for the US, G and M for the UK, D for Germany, I for Italy and so on). The ITU regulates the international usage of telephone, telegraph, data, radio etc. It became a dept of the UN when the UN was founded in 1945 and before that it was under the League of Nations in Geneva, Switzerland. The ITU is called a specialized dept of the UN and the Telephone money is a great source of revenue for some small countries. Radio is included since international conferences have delgated radio to the ITU since 1906. The ITU has set up the international allocations in regard to Marine, Business, military, amateur, radio telephone, medical devices and other radio services. The standard ITU agreement cover any type of electronic communication and is many pages long with technical BS from DC to Light. Every country on this planet has signed the ITU agreement since international interconnection depends on ITU standarization. Some countries are not close followers of ITU and some have no central functioning governments but those that do (about 99 percent of the world) want that telephone money."

"The FCC administers the Civilian Portion of this program in the US and the NTIA (see www.ntia.gov) allocates usuage in the US for government and military usage on the Federal Level. (Some of freeband is NTIA stuff!). The FCC and FBI have concurrant jurisdiction with NTIA stuff. SCARY..."

"On the International level, ITU allocations differ from region to region, most of the Western Hemishpere is in Region 2 (Ham Test Question). CB radio in North America (Canada and the US) is 40 channel AM type emission (called A3 in ITU parlance) with a limitation imposed by only the countries themselves. In Central and South America, These so called export radios can be used on different channels since each country can set their own standards. (Hint: 26 to 28 Mhz around the world has been allocated to individual countries usuage, so each country may set up its own type of radio service as it wants). The high power stations from the south are mainly business types since VHF and UHF radio are so expensive. Costa Rica allows usuage of up to 100 watts ERP on Radio Personal which is their name for CB. Belize allows Business usage radio upto 35 watts on CB with extra channels available. This will shed some light on why CB is low priority with the FCC. The only

beef I could see with this arrangement and the ITU is that the ITU agreement states that the general usuage band we call CB can not be used for international contacts. Unless some country complains, the FCC will only pay minimal duty to the CB Band, however, some countries have been complaining about our CB and Ham Bands which I think has sparked the current round of enforcement. CUBA has complained about interference to its ham nets and repeater systems (We do pay some attention to Cuba since most Carribean telephone and microwave links pass by and through CUBA by international agreement from Florida)."

"I would recommend looking at the FCC website, searching the UN and ITU with search engines, The ARRL has a portion (chapter) of the rulebook outlining the ITU and relationships."

"The main reason I got an Amateur Radio License was to communicate with home and almost every country honors an Amateur license without fail, however, there may be some bookwork involved but recip licenses can be obtained and it clears the path for you to carry radio gear in some countries which have a different view about 2 way radio."

"In Columbia, CB radios are illegal without licensure and possession of unauthorized radios will put you on a collision course with the local gendarmes. Had a friend who was a radio hobbist who worked in Columbia on a Drilling Rig in the Jungle. He brought his scanner and 2950 10/11meter radio and got through customs (Oil drilling equipment) but on the rig, his radio skip chasing got quick notice form the Columbian Authorities (HOW? I really don't know, but I suspect drug/guerilla fighting). The legal hassle without a license cost him his job and expulsion from the country. He was asked, he told them he was a Ham and they asked for a licnese and found he wasn't licensed for Ham in the US, he was told he would have been eligible for a reciprical license but illegal operations were another thing. A $100,000 a year job lost."

"73 de Martin N5PZJ"

to repeat martins text in it's entirety will keep me from being accused of taking words out of context.

NOTE TO MARTIN: please correct me if i misinterpret anything here.

" These so
called export radios can be used on different channels since each
country can set their own standards."

if we signed the ITU treaties, are we not entitled to the same rights under these treaties? with this, i should rest my case but i won't. there is much more.

"CB radio in North America (Canada and the US) is 40 channel
AM type emission (called A3 in ITU parlance) with a limitation imposed
by only the countries themselves."

so why is this the best kept secret in the U.S.A.?
either there are a whole bunch of hams, (RF police), who don't do anything but the ARRL lock step on this subject, or they are greatly uninformed, (as i was), on the political history of RF communications.
the "because i said so" bullshit never did cut it with me and now Martin has just ripped the edges from your RF swords with some rocks of truth.

"(Hint: 26 to 28 Mhz around the
world has been allocated to individual countries usuage, so each country
may set up its own type of radio service as it wants)."

so why are we so far behind the 3rd world on this???
because "I SAID SO" said so? more bullshit.

" Costa Rica allows usuage of up to 100 watts ERP
on Radio Personal which is their name for CB."

"I SAID SO" strikes again.

"The only
beef I could see with this arrangement and the ITU is that the ITU agreement states that the general usuage band we call CB can not be used for international contacts."

i don't know when this was written into the agreement but, in this day of comparitive world peace, it doesn't seem to be needed anymore. there is always going to be some trouble in the world and if terrorists need long distance comms, they can always go to illegal use of high freq, short wave or the so-called "numbers" station set-ups or even something as simple as a telephone. this rule is no longer needed, nesessary or wanted by the majority of the people that it affects the most. the cb'er. if these rules were to change, they would apply to hams and cb'ers alike so the hams would be welcome to increase their power / channel capabilities if they don't already have them. many do but the ones that do, won't admit it in public and the ones who don't, deny that any of the others do.
the only real, major opposition to any rule changes comes from the RF police types who appear to hold on to their licensed power / bandwidth privledges with great jealousy as they act like we should have to run the same gauntlet that they had to in order to get useful HF communications.
their effort is laudable but not nesessary for an average family when one partner has the electronic appitude to pass the test and the other and / or the children don't.
if the FCC would exercize their LATITUDE in this matter as mentioned above, there COULD be a license similar to the old cb license for a medium high powered "free band" that anyone in any family could get and use. my wife hasn't got a clue about electronics and is not interested in learning but knows enough to turn on a radio, change a channel and key a microphone.
for reliable communications between home and my job, for us, would require somewhat more than 4 watts am or even 12 watts pep. 100 watts pep would be a start in my case but i couldn't see a need for more than 300 watts max for this band.
i've talked all over the world from my mobile on 200 watts pep so it's not that big of a deal for 300 watts. one should be able to go anywhere with that. and

if the band isn't open, more power won't make a difference anyway.

"Unless some country complains, the FCC will
only pay minimal duty to the CB Band, "

here's the key!!! as long as there are people in charge of the FCC who are biased toward the ham communities' position, there will be no fair hearing for cb'ers.

"CUBA has complained about interference to its ham nets and repeater systems
(We do pay some attention to Cuba
since most Carribean telephone and microwave links pass by and through
CUBA by international agreement from Florida)."

this is a ham frequency problem. not a free band one. can't blame us this time.

"some countries have been
complaining about our CB and Ham Bands which I think has sparked the
current round of enforcement."

this is something that could be worked out with an enforced, LICENSED band with whatever adjustments to frequency and power allocations needed similar to the 5 skips within the first 23 channels of cb for r/c freqs.

to all of you RF police people out there,
if your parents would have slapped you down with a, "because i said so", and no other explaination every time you asked the question "WHY", you'd get pissed at them in a hurry.
this is the way that we've been treated here on this news group.
and then, to find out that all of the RF police either were mis-informed, too lazy to actually do some good by spelling out the situation as Martin has here, or lying / hiding the truth because it DOESN'T support your position has just un-plugged the last piece of life support afforded to your credibility.

now why don't we start over with some HONEST dialog and knock off the "BECAUSE I TOLD YOU SO" and the "BECAUSE THAT'S THE LAW" bullshit as well as the mis / dis-information that has been splattering our screans here for the last 3 months.
laws are laws and RULES are RULES.
as has been the history of the United States for more than 200 years, if certain laws and rules wern't changed in our history, we would be singing God save the queen or, if we didn't change our laws about being neutral during the 2nd war, we would be singing hail the furor, praise the emperor, (not the radio), or be VERY alone in a world of teriney. each were made to be changed when they have been found, BY THE PEOPLE, to be out dated, out moded or unfair. these rules, by the changing face of the present LEGAL aspects of cb alone with linears and out-band issues aside, and by the shear numbers of cb's in use today, are very out moded. cb will NEVER be the same as it was in the "good old days". if everyone were to junk-box their linears at mid-night tonight, in most metropolitian areas, comms of more than 1 or 2 miles would still be impossible with either the number of cb's on the air or the proliferation of high rise buildings that didn't exist in the 50's when cb was born. under these conditions today, there IS a need for either higher power or more channels.

> Okay Jeff, I read all that Martin has said. How does any of that
>support anything that you have said in this newsgroup? And how does any
>of it contradict anything that we have said in this newsgroup?
>
if you have any questions left, re-read all of the above.

>And, while you're at it, perhaps you should also tell us why Martin's
>opinions (the opinions that you say supports what you have said) are
>more valid than any of the other opinions posted in this newsgroup.

Martin has cited references that are relevant to the questions asked.
he hasen't only quoted from the holy book of "I SAID SO" like the rest of the RF police department has.
the questions asked were NOT, "what are the rules?", which has been the only thing quoted.
the questions asked HAVE been, "why do these rules exist and why can't they be changed?" no one has given an authoritative answer in 3 months.
here. now we have answers WITH references and they don't happen to agree with the RF police position. here comes the halo again.
just because you don't agree with what appears to be the truth backed up by references, now you call into question the credibility of the messenger. take another last gasp, friend. you're failing fast.

> Perhaps you should invite Martin to this newsgroup to read some of the
>messages you have posted. I doubt he would be so friendly afterward.
>
i have, he is welcome to review my posts and draw his own conclusions as he is free to do so.
by the attack that you fired at him first thing in your response to my attempt to present FACTS in a neutral non-adversarial fashion, i think he can get an impression on which side started the war.

either way, like me or not, i want to thank Martin for his contribution and education, in a neutral manner, on this subject which can lay to rest a lot of mis-conceptions that have flown around here IF people will research said references and get out of denial as it only makes them look more foolish.

NOTE FOR MARTIN,
just so i don't get accused of hiding anything, i have been a strong supporter of power and the out-bands.
i have also been harsh and vulger in my reponses but, generally, in self defense of myself or others who have been attacked and clubbed by the RF police here in the last 3 months.
if you can pull up my posts and the postings that i was responding to with them, i think you'll understand why i was the way i was.
if the RF police were to meet me / us eye to eye as you have here, they would have met with the same respect as you have from me.
it seems that they don't come here to "elmer" or educate but to try to push us down or bully us into getting a ham ticket because, "I SAID SO", said so.
ham licenses are great and i'm all for them for the people who want them. my only point is that ham is sometimes too much and cb is not enough for some people. frs can be out of the question sometimes too.
the rules do exist. can they be changed? if not, why not? if so, how? and what

do we have to do to get a fair hearing from the FCC.
some will say," stop breaking the rules and they will listen".
if everyone stopped breaking the rules, they would say, "there's no need to change anything as the band has settled down.
the squeaky wheel gets the grease except in our case, they grease the hub and insert a new shaft.
this will not improve comms much as the surface of the earth and it's changes in the metro areas will not shrink shorter to accomidate anything and the number of "legal" radios will stay the same with all the associated pile-ups that happen on a daily basis.
i hope this has answered ALL of the questions that you have asked of me on this post.
if not, re-read the entire thing 9 more times and then feel free to e-mail or post your questions again.
this is your one and only "FREE COUPON" to go over this whole bowl of hash ONE MORE TIME. coupon expires 11/16/2000.
get your stuff together, if nesessary, and ask away.
after that, i will answer you with a long string of HAHAHAHAHAHAHAHAHA's.
have a good night.
jeff
P.S.
you asked, so i hit the e-mail box.
it won't happen again unless you e-mail me again, personally as you've requested.
jeff

18 feet IS a half wave. It IS a half wave antenna.

> The Antron 99 is a loaded 1/2 wave over a loaded 1/4 wave, variable
>mutual
>transductance tuned vertical antenna! "Anyone who had read the
>advertising
>would know this"!

Wow! Can you repeat that again with a straight face???

How do you make a loaded 1/2 wave and place that over a loaded 1/4
wave? And exactly what is all that "loading" supposed to do? It sounds
like pure unvarnished CB hoo-doo jargon!

1.) Collinear antennas obtain gain by virtue of the physical
separation of the current loops. If the antenna is 1/2 wavelength
loaded over a 1/4 wl, as you claim, the MOST you can possibly do is
move the current maxima's maybe ten feet apart.

Collinear gain would be very small indeed, unlikely to have much more
FS than an "unfancy" 1/2 wl radiator.

2.) This loading, at the same, will decrease the ampere/feet of the
radiation areas of the antenna while adding loading system losses.

Woops, there goes the collinear gain!

> The term colinear simply means "in a straight line". Any antenna
>using 2
>or more discrete elements stacked one above the other, is a colinear
>array.

...and the gain depends on the physical spacing of current maximas, as
well as the area of those maxima's.......

>To be exact, it is a 2 element stacked colinear array for the 10 and 11
>meter bands!

A collinear that doesn't occupy any spatial area. What a magic trick!

> The Antron 99 is a half wave over a quarter wave variable mutual
>transconductance tuned antenna.

Supercalifrigerespealidosis, that word that I invent to impress the
girls the most'est!

>When you add the ground plane kit it
>becomes
>a true colinear antenna.

With no element spacing? As opposed to a false one?

>During the last several months, with the

>of days of high solar x-ray activity, I have maintained semi-consistent
>contact with several stations in Australia using an HR-2510 running 40
>watts
>on ssb with an A-99 with a feedpoint height of approximately 74 feet.
>(92 feet to the tip)

Wow, that's more impressive than Fractenna's runs! Imagine running 40
watts and working all the way to Australia on 11 meters during a
sunspot peak! I'm awestruck with the magnitude of such a difficult
accomplishment!

> A simple 1/2 wave colinear array consists of two halfwave antennas,
>one
>stacked above the other. When you add the ground plane kit to the basic
>99,
>this is what you end up with.

Does the groundplane hang straight down, to make it a truer than true
so'nuf collinear?

> Many have disputed this, and usually because:
>
>#1 They see it is 18 feet long and assume it is
>a halfwave antenna based on physical size.

Sounds like a half wave to me, unless Chip measured it fractally.

>#2 They have simply never read the advertising.

I know I trust advertising men.

>#3 They have never seen the inside of the A-99.

...and would they know what they were looking at, besides a bunch of
wyers and steff?

> And you know what? That advertised figure of 9.9dbi. (i=isotropic
>source
>/very few people know what this is) isn't that far off. Subtract a
>couple
>tenths of a db. from each of two loaded halfwave antennas then add 3db.
>for

>stacking and you'll see that this figure is fairly accurate.

Bull. Get your charts out and have a gander at collinears. 3 dB gain requires the current lobes be separated 3/4 of a wavelength physically. And that gain is gain over whatever a single element does.

If you load the single element, the gain drops.

So if you stacked "your" antenna current centers 3/4 wl apart, the gain would still be less than a true collinear with dipoles because the individual elements are loaded.

Now, unless you've found a way to fold space... you'll have a tough time seperating the current centers 3/4 wl in an antenna 1/2 wl long.

> Example top loaded halfwave = 3.0 db.
> *bottom loaded halfwave = 3.0 db.
> gain from stacking = 3.0 db.
>
> Total gain = 9.0 db.

Get real. What is that crap, new math?

> * includes ground plane kit
>
> Jack

Jack, seriously now....that stuff you came up with is all a bunch of crap.

I dunno about apples and oranges, but you've got to be eating, drinking,
or smoking something powerful if you believe the stuff you're writing.

By the way it's dB, not db.

:
: And you know what? That advertised figure of 9.9dbi. (i=isotropic
: source
: /very few people know what this is) isn't that far off. Subtract a
: couple
: tenths of a db. from each of two loaded halfwave antennas then add 3db.
: for
: stacking and you'll see that this figure is fairly accurate.
:
: Example top loaded halfwave = 3.0 db.
: *bottom loaded halfwave = 3.0 db.
: gain from stacking = 3.0 db.
:
: Total gain = 9.0 db.

You had better do some basic research on antenna stacking, Jack.

If you have two 3 dBi antennas, and you stack them at ideal spacing,
you gain 3 dB over the gain of ONE antenna - not the sum of the gains
of both.

So the gain for 2 stacked 3 dBi antennas is 6 dBi.

Dave Hall (nojunkmail_n3cvj@worldlynx.net) wrote:
: >
: > Not according to the old timer hams that I've known. It was used a
: > lot for shooting DX because it has more frequent band openings that
: > most other bands.
:
: What?!? 11 meters is virtually identical to 10 meters in DX propagation.
: And that propagation is dependent on active sunspots to be usefull or
: frequent. Other ham bands, that are lower in frequency, have much more
: consistent and predictable DX conditions. When the sunspots are high,
: you can't beat the DX on 10/11 meters, but when it is low, the DX is not
: there at all. 20 meters has DX almost any time, as does 40 and 80
: meters.
:
: 11 meters also had interference from ISM devices that were also assigned
: to the band. This made the band less desirable than 10 meters.
:
: 11 meters was also an oddball in harmonic relation to the other bands.
: Look at the other ham bands 80 meters is twice 160, 40 is twice 80, 20
: twice 40, 15 is 3 times 40, 10 is twice 20. This makes antenna
: resonances easier to make for multi-band operation, as well as crystal
: frequency synthesis. 11 meters does not conform to any of these schemes,
: so special antennas or tuners had to be used, as well as special
: oscillators for frequency generation.

Yep. Contrary to what the other person posted - Hams had little or no
objection about 11 meters being allocated to other uses. The reasons
you state are the primary ones. The band was almost totally unused in
the 50s by Hams.
:
: That's where you're wrong. Hams have to take a test to demonstrate that
: they understand what they are doing (even if the test is administered
: like a joke). Most CBers wouldn't know the difference between a class C
: and a class AB1 amp, unless their local "tech" tells them.

Neither do a good share of Hams these days - including the Techs. The
worst thing that was ever done was deciding to publish the question pool
and make it multiple choice. A person can get their Extra ticket, and
not understand a bit about electronics - just have the ability to copy
20 wpm code.

: > According to the ham test
: > study book I have even the no-code tech class hams can run 1500 watts
: > on all bands they have rights to if such is needed to get clear comms.
:

: Not entirely true. 10 meter operation is limited to the novice power
: level of 200 watts.

A no-code Tech cannot operate on 10 meters. That requires a Tech plus
license.

I ran an Antron-99 with a ground plane kit for about five years. It was on a 36ft. mast on top of my roof. Now I run an I-MAX 2000 only on a 10ft. mast up on the roof. My I-MAX is about 26ft. LOWER (not counting antenna length) than my Antron was. My I-MAX 2000 BLOWS AWAY my old Antron-99. But the antron handles high winds better. The Antron is 18ft. long, and the I-MAX is 24ft. long.

I think the whole LT front panel is backlit not sure about the electronics
or drift stability, anyone know more?
I need to get one for the car.

Yes, he does..i guess since +1 hour of the UK time, hehehe.
Its nice to see some site with some effort involved showing up now and then
for CB stuff.
I think its time i updated my links pages so if anyone has any CB related
sites you have found interesting, let me know!

Regards

Okay, this is the last time I'm going to comment on this, John. READ THE ORIGINAL MESSAGES FOR YOURSELF. Tim did not say dxcc countries. He specificially said countries. He did not change his claim to dxcc countries until several messages later when someone else brought that up.

Tim has come back now with a twisted version of his original claims, hoping that nobody will go back to see what he actually said in those earlier messages. I'm more than willing to stand by my original statements - it is Tim that is changing his claims.

However, I've had enough of this nonsense. If you want to believe that Tim has contacted 112 countries under the conditions he origionally stated, than more power to you. I've given my opinion on this subject (over and over) and do not plan on endlessly repeating myself.

Yep, I noticed that. It's a big improvement on the radios that they have carried in the past. Price is a little high on the Washington though. I've seen it for somewhat less at other mail order sources. Of course, I've seen the A-99 for less also.

I guess it depends on how much you value immediate availability. If that is important, then neither is greatly overpriced.

You know, these radios have really come down in price over the years. I can remember when the Washington was priced at about $600, and the Cobra 1000 was a bargain at about $550. And I paid that much for a Cobra 1000.

I guess the "good ol' days" were not always that good. :-)

You know, I also had a base station antenna from Radio Shack many years ago. It wasn't a Crossbow (at least I don't remember it having that name), but it was a darn good antenna. I received a lot of positive reports about it. It out-talked my neighbor's antenna by a long shot. It even did better than the three element beam that I had on the other side of the yard at the time.

But that antenna was discontinued many years ago and I have not seen anything like it at Radio Shack since. The antennas they have had over the last few years don't seem to work as well (at least that is what everyone says - I've had no personal experience with them).

Maybe that is why they decided to replace them with the A-99.

I haven't seen the Crossbow recently, but the A-99 is a little more advanced than what you describe. The top section has coiled wire running throughout the entire length. And, if I remember correctly, so does the middle section.

I'm not sure what the bottom section has. It is smooth on the outside with no visible wiring showing through the coating.

More importantly, the A-99's performance is outstanding. It has very wide bandwidth, with very low SWR over that entire bandwidth. And I have yet to see a similar styled antenna that can perform better than it does.

That may be the case here,

BUT!!!

It is common among HF circles to refer to the DXCC entities as countries.

Hell, if you look at the DXCC award rules, you will find that EVEN THE SPONSOR calls each entity a country!

John,

A properly adjusted rig, with an 'unlocked clarifier', should have the clarifier 'tracking' so that you DON'T have to muck. Where you run into trouble is people with 'fixed' transmit, each being slightly different, or misadjusted rigs.

But the big assumption here is 'properly adjusted'. With all the crappy mods done to rigs by people who have no idea what their doing (the saying a 'little' knowledge is dangerous really applies here, and it must be DAMN little!) no wonder most people have problems. I've seen people unlock clarifiers and NOT readjust them. And people tie them to voltage reference points in their rigs that just plain aren't stable enough and they sound like crap. Really, you should NOT be able to tell an 'unlocked' clarifier by it's sound on the air. The only thing that should give it away should be the fact the radio can 'move'. There's just too much shoddy crap out there.

Idealy, your tuning should work with BOTH your TX and RX, and they should track together. THEN you might (probably) want what's called RIT. I know, it's been mutated to say it stands for receive incremental tuning, but the very first time I saw that function on a rig, it was described in the literature ad "Receive Independant Tuning". This allows you to move your receiver around slightly without changing your TX.

Mike

Standard communications quality AM is about a 6 Khz bandwidth. But I was not talking about Full carrier DSB AM, I was talking about SSB. Typically the bandwidth of an SSB signal is between 2.5 and 3 Khz. With this in mind, it gives rise to the belief that 2 signals on opposing sidebands can occupy the same channel, without interference. In practice this is only possible if the stations are not strong enough to overcome the bandpass filter's rejection. We used to do it in the 70's when channel 16 was the only "sideband channel". We had one group on USB and another on LSB. There were few problems with co-channel interference. We helped the situation by moving our clarifiers away from the other sideband (Radios had moveable TX/RX clarifiers out-of-box back then) instead of staying center slot.

If you run a narrower filter (1.9 Khz for example), you increase the rejection of the unwanted sideband, and will increase your ability to co-habitate on a channel with a person of the opposite sideband. The trade off, is that you roll off much of your audio fidelity. It will still be copyable, but just not as pleasent to listen to.
Narrower filters also have the added benefit of increasing the signal to noise ratio, which means better overall receive sensitivity.

If the FCC were to be hypothetically thinking about creating a "legal" freeband (I know the terms are mutually exclusive, but I'm just trying to illustrate a point), they would be able to make channel spacing 3 or 4 Khz wide, if we allow SSB only, which would effectively double the amount of channels available over what we would have with DSB AM.

If you stick with SSB, you can throw away the redundant sideband, and
you no longer need the extra bandwidth. Your fidelity at 3 Khz on SSB,
should be no worse than the normal 6 Khz on AM.

Communications grade audio is typically in the 300 - 3500 Hz range,
which is only about 3 Khz of needed bandwidth. The only reason we have
to double it, is to accomodate the extra sideband in the DSB AM signal.

I'm sure that the FCC officials are very well "aware" of the CB band for whatever reason.

>
> Anyway, I have not seen any negative attitudes towards CB by the
> officials at the FCC. I have seen a demand that the rules be obeyed,
> and I have seen enforcement actions taken against those who did not obey
> the rules. But, I have not seen CB treated any differently than the
> other radio services.

The CB band HAS been treated differently. They have been mostly ignored by the FCC, since the FCC basically threw in the towel, when they eliminated the license requirement. When that happened, the CB band ceased to be a legitimate radio service, in the FCC's eyes, and became what it is now, a vast wasteland of frequencies, where the rules are no rules. The FCC only responds to flagrent interference problems. Other than that, until recently, the band was left to be whatever it was.

It looks to me that the CBer's got a case of "You asked for it, you got it", from the FCC. Since so many people never bothered to get licensed, even when it was required, the FCC eliminated the license, and with it, any sort of protection that the license gives you from interference. The FCC could not keep up with the wave of illegals, so rather than look ineffective, they abandoned the band.

This may be changing now, but the FCC still needs a ton of money to do an effective enforcement, unless the burden of policing the CB band, falls to the local law enforcement types (I hope that NEVER happens).

I think if the FCC was serious in providing a radio service for the citizens (In light of the relatively affordable competition from cell-phones), they would just do better to create a new band where DX would not be a problem, and far enough away from other radio services, that equipment could not be readily adapted.

My vote goes to the 72-76 Mhz band. Much less skip, but not so line-of-sight, as UHF, and not much commercial equipment that would drop in and be used without major modifications.

Funny thing. Back in the early 80's, when a guy named Dick Bash started polling freshly tested hams, to put together his "study guide", which contained actual test questions and answers. The ARRL and the rest of the ham community jumped all over him, and accused him of circumventing the learning process, and lowering the "standards" for becoming a ham.

In comes the VEC program and what does the ARRL do? Publish a "study guide" with the pool of questions and answers. Talk about hypocracy! This is one reason why I am not much in support of the ARRL.

Note that the limitations imposed relates to emissions. The FCC could
give the CB band FM, but what's the point? What is their incentive?

>

The CB band was not intended to be more than a SHORT RANGE SERVICE. You
keep missing the point. It's violation of ITU regulations to be anything
else.

> "The only
> beef I could see with this arrangement and the ITU is that the ITU agreement
> states that the general usuage band we call CB can not be used for
> international contacts."

And THIS is precisely the reason WHY the FCC can't and won't expand the
present CB band to DX type operation. That takes the wind right out of
your "why can't we DX" arguement. THAT is why.

> i don't know when this was written into the agreement but, in this day of

> going to be some trouble in the world and if terrorists need long distance
> comms, they can always go to illegal use of high freq, short wave or the
> so-called "numbers" station set-ups or even something as simple as a
> telephone.

Think MONEY. The ITU is also a regulator of communications commerce. If
they allowed international radio communications by "citizens", then they
would use the free airwaves to circumvent paying long distance telephone
charges.(loss of revenue for the communications companies that support
the ITU) In fact, if you look at earlier FCC CB regs, there was a
section that stated that CB could not be used if another form of
communication existed (Since most cars did not have phones in them in
the 60's, a base-mobile contact was considered legal, but 2 base
stations should not communicate if they both had phone service
available.

> this rule is no longer needed, nesessary or wanted by the majority of the
> people that it affects the most. the cb'er.

It's nice that you think that the whole world's communications, the ITU,
the FCC and other agencies across the globe, are subjucated to the whim
of US CBers.

> if these rules were to change, they
> would apply to hams and cb'ers alike so the hams would be welcome to increase
> their power / channel capabilities if they don't already have them.

Ah Obi-wan, come! Join the dark side. There is POWER on the dark side!

> many do but
> the ones that do, won't admit it in public and the ones who don't, deny that
> any of the others do.

So, since there are a bunch of lawless radio ops (hams and CBers), we
should kow-tow to their wishes, to operate above the law.

> the only real, major opposition to any rule changes comes from the RF police
> types who appear to hold on to their licensed power / bandwidth privledges with
> great jealousy as they act like we should have to run the same gauntlet that
> they had to in order to get useful HF communications.

Why not? If you want something, you should have to work for it. The
value of something is proportional to the amount of effort it takes to
achieve it. Your idea of "RF welfare" is just a product of a small

thinking person, who can't see the "big" picture, otherwise you wouldn't question why the FCC, the ITU or whomever operates, and the reasons for the rules. You see each and every rule as an affront to your personal "rights". You can't see beyond YOU. You come off like a spoiled child, which is why no one will take you seriously, except maybe, other disenfranchised, persecution complex people.

> start in my case but i couldn't see a need for more than 300 watts max for this
> band.

Why? On the CB band, when the DX conditions are not there, I can talk 30 or 40 miles with 4 watts, and even more with 12 watts on SSB.

On the GMRS bands, you have access to repeaters that give your child's handheld the same coverage as your base station. This is more than adaquate, for a dependable reliable family communications service.

> i've talked all over the world from my mobile on 200 watts pep so it's not that
> big of a deal for 300 watts. one should be able to go anywhere with that. and
> if the band isn't open, more power won't make a difference anyway.

Now the other shoe drops. You're not REALLY interested in creating a "family" communications band. You REALLY want a free ticket to talk DX. That ISN'T GOING TO HAPPEN, until the ITU relaxes the rules.

If you'd spend your time and energy studying for and passing your ham test, you'd have what you want, instead of crying and whining about your "RF Welfare" band, and how "unfair" we all are for agreeing with the current system.

> "Unless some country complains, the FCC will
> only pay minimal duty to the CB Band, "
>
> here's the key!!! as long as there are people in charge of the FCC who are
> biased toward the ham communities' position, there will be no fair hearing for
> cb'ers.

You cannot substantiate with any sort of solid evidence that this "ham bias" exists. Even when you've been given the reasons from a source that

you somehow trust, you still continue to banter on about the FCC
changing the rules that they have no control over. The "Ham bias", that
you claim, exists only in your persecuted, disenfranchised, and somewhat
paranoid mind. You sound silly when you keep making these claims,
especially when you can't back it up.

> no other explaination every time you asked the question "WHY", you'd get pissed
> at them in a hurry.

NOBODY has ever told you "because I said so". I, and others, have told
you on numerous occasions about the ITU, and why we can't have an
international CB band, and you still refused to accept it, until another
person corroborates the story. And now you can't accept the rationale of
the ITU, and think that they sould just change their rules JUST FOR YOU
and other supporters of "RF Welfare". Well, you can try. But you have to
make your case, and not just because you say so.

> this is the way that we've been treated here on this news group.

> lazy to actually do some good by spelling out the situation as Martin has here,
> or lying / hiding the truth because it DOESN'T support your position has just
> un-plugged the last piece of life support afforded to your credibility.

You really know how to spin doctor information. What have you learned?
The ITU regulates international communications.
The ITU has set aside "purpose" bands, that local governments are free
to regulate within the ITU guidelines. However they are not free to
travel internationally. What's here that has not already been said by
several people?

>
> now why don't we start over with some HONEST dialog and knock off the "BECAUSE

If you're THAT interested, Engage the use of your mind and a search
engine, and research the ITU and related material yourself. Unless of
course you belive that the internet is "ham biased" as well.......

> NOTE FOR MARTIN,
> just so i don't get accused of hiding anything, i have been a strong supporter

Anything for free right?

> i have also been harsh and vulger in my reponses but, generally, in self
> defense of myself or others who have been attacked and clubbed by the RF police
> here in the last 3 months.

The majority of your "defenses" have been laced with a persecution
complex, innuendo, conjecture, and supposition (With no proof), broad
generalizations, stereotyping, ad hominem attacks, and paranoia. Not the
things to base a meaningful dialog on.

If you want the rules to change, you have to first understand WHY they
were created first. In order to do that, you have to get over that "Hams
are out to get us" complex. Once you understand the BIG picture, you can
judge for yourself if large international organizations, like the ITU,
may be reluctant to grant your wish. Your job is to mount an effort
(Yike, sounds like work!), to come up with clear, consise, logical and
meaningful reasons to support your position, and then to submit it, in
the proper forum.

Are you serious, are are you just another one of those "why me" types who sits and cries in their beer, but never makes any effort to bring about change.

My respect for you would increase dramatically if you acted on your notions to bring about change instead of trying to shove them down the rest of our throats. While we already know the reasons why and can accept them.

What horrible rules? The restriction on radios in aircraft is to
protect the avionics. The real power at the FCC is the Telephone
powers.

Just a minor nit picky point.... The dBi of a half wave vertical antenna
in the real world is < or ~2.15, not three... And with matching losses,
the stacking gain in the real world is more like 2.5dB, not three... So
we get 2.15 + 2.5 = 4.65dBi (and this is on a good day, with a tail wind
and favorable sunspots, and a salt water surface - YMMV, SAR, BNI)
I strongly urge those who are impressed by manufacturers claims about
antenna gain to do some basic reading on antennas... Radio shack has
some books... The ARRL has a ton of books on antennas... The RSGB has a
many books... CQ magazine advertises a library of available books...
Ditto for 73 magazine... There are many independent authors offering
books... Your local library can borrow any book in the world through the
interloan program... (Zero cost to you - zippo, nada, nyet)
AND, there is an entire world of antenna theory available right here
online... Just use the search engine in your web browser...

Your RF Police will be covered in a future posting. The ARRL has no
official position on the CB Service expect to make sure an adverse
ruling regarding CB isn't carried over to the Amateur Service. Example
Hb 2346. see=www.thomas.gov

> What "rocks of truth"? There is nothing that he stated, that we don't

No, it is much easier to explain in polite terms the legal, moral,
scientific and rationale behind rules than to say I TOLD YOU SO.
Edification should be the main purpose of newsgroup without judgment
being passed.

> else.
>
CB Band was originally set up to be for personal and business use in the
mid 1950s by the FCC. Due to the limitations of Electronics and
Transmitters of the day, VHF and UHF was basically very costly to
develop radios for transmission. (Early CB weren't a bargain either-my
father's Black Face Johnson cost over $200.00 a piece in the mid 1960's
now=to about $1000.00). So, 27 MHZ, was "borrowed" from the Amateur
Service as it is believed (BUT ITU didn't recognize any allocations in
the 10 meter band below 28.00MHz, the FCC just decided to let the Hams
park there and "study" the band?) The 150 mile (250km) rule was placed
in effect but lets face it, propagation is a force of nature and the 27
MHZ region is affected by skip, propagation or whatewver. However ITU
regulations frown on International Contacts Outside Common Carrier
Circuits due to revenue loss to the phone COMPANIES. Even Amateur Radio
has very strict 3rd party regulations between countries. In the US,
repeater phone patch rules are very strict.
and was established in
> > "The only

>
Phone patch rules on CB were only adopted reluctently since phone
companies had mobile radio telephone service. Telephone Patches on
Amateur Repeaters can be a major source of sore spots even
today-cellular wants its pound of flesh.

>
> We have one. It's called GMRS.
GMRS has been downplayed by the FCC and the licensing scheme is complex
to say the least. It was old Class A CB. License costs $75.00 for 5
years, repeaters can be used or placed in service, it is in the 460MHz
area. A family only needs a group license, power limitation is 25
watts, portables allowed, auto patches allowed and a portion of the
frequencies have been turned over to FRS on a non exclusive basis.

The rules at the FCC ar usually bassed on the laws of physics as to
transmitter power, propagation and frequency usuage. Popular demand
could have created havoc in 1912 when the first Radio Laws passed. So
many people were setting up their own "radio stations" that the
commercial interests cried foul. With crude technology, there wasn't a
lot of room for the plethoria of transmitters which covered the airwaves
each night (Freq in use were below 1000 khz) so the congress stepped in
and turned radio over to the US Navy which promptly banned "Amateurs" to
below 200 meters, hence the cry 200 meters and below. Licenses were
granted by the Navy Dept to Amateurs but the cry to Congress was
tempered by the testimony from the Bureau of Standards explained to the
Congress how RF spectrum worked or so how they believed. With Amateurs
banished to 200 meters and below (1500 KHZ on up) Amateurs went ahead to
discover HF after WW I (In which ALL RADIOS were verboten!) Logic is
the key. Read about Radio History in the Days of the Giants.

>73 Tom

Hi Tom,

I had also commented on that fact earlier and was told I was wrong.
Funny no references as to why I was wrong.

I can't seem to find where I'm wrong in the reference books here, but
then again what do people like Kraus, Jasik and the like know about
antennas?

Funny, I can't even get NEC modeling programs to show that adding
radials lowers the take off angle. Changing ground conditions? Yes.
Adding radials? No. They do increase the gain slightly by improving
the antenna efficiency but not the angle.

Of course, if you wish to blindly forge ahead with nothing more than
an advertising brochure as a foundation - then all things are
possible.

Dave,
You should read up on the early history of broadcast radio.
It was chaos. There were no controls or standards for frequencies
or quality. Any "flea power" station could power up on any
frequency and interfere with the competitor. Radio stations
were free to overpower the other stations and be as wide as
they thought was necessary to block or jam the other stations
on the band. The FCC put a stop to all this requiring the
licensing of all broadcast stations and limiting them to certain
band segments. Without the FCC the AM broadcast band would
sound just like the CB band. If you look for commies under
every rock you're sure to find them. I would say that the
FCC is closer to Romans than Marx because it curbs irresponsible
interference and controls the quality of the stations. If
it was a Marxist type creation it would require stations to
air only certain types of content and would jam incoming
signals from other countries.
Kevin, WB5RUE

>Bravo on Jeff's remarks

thank you.

for the last 3 or 4 months, i've asked, in a nut shell, why are the hams here
if ham radio was so great?

why do they have to come here and shove their views down our throats?
if cb is so bad, why don't they abandond it for the holy grail, the ham bands?

if they are going to come here, if they can't help someone, don't like the
subject matter or if they don't have anything positive to contribute, don't say
anything at all.

i may not know as much as some hams but i have gone to rec.radio.amateur and
answered some of their questions.
i've gone there and asked a few of my own and had gotten answers in a
respectful manner, even when i've stated that i was an out-bander.
my questions wern't technical in nature but pertaining to RF phylosophy and
regulations. i didn't always get the answers that i wanted or agreed with but
they were friendly. here, if you ask a question about amps or mods, you get
someones keyboard shoved down your throat.
there was one poor guy here 2 weeks ago that asked a question about an amp.
the flame thrower came out from one ham shack billowing threats of the FCC.
if the ham would have looked at the guy's e-mail address, he would have seen
that it ended in, ". UK".
no FCC regs there.
it is things like this that has given them the name RF police.
not all hams are like this though. even some who disagree with the alternative
cb life style. they are either neutral or helpful on antenna, power supply or
in non-technical issues.
this is all we ask.
jeff

Nope, here are the definitions:

Liberals have rights, real and imagined. They want government to pass laws that guarantee that no one will violate any of their rights. They have no responsibilities, it is up to government to take responsibility for everything.

Libertarians have rights, real and imagined. They want government to pass no laws that would violate their right to do what they feel is right, which is up to their own individual interpretation. Responsibilities? They take responsibility for only those things that would not hinder the exercising of their rights.

Conservatives have rights, real and imagined as well as responsibilities. They want government to pass laws to remind us the difference between our rights and responsibilities. There can be no freedom without responsibilities.

They must be fools , because they never had the benefit of being
educated at Roadway Tech.

I think this explains the widespread lack of understanding how
antennas work on 11 meters. Things are, well, just different on that
band.

[Somebody asked how is SWR measured]

> Greetings!
>
> Via voltage.

You're half right. An SWR meter senses both voltage and current. This is how it creates the directional effect to separate forward power from reverse power. It takes advantage of the fact that forward current is "in phase" with the forward voltage and the reverse current is the opposite phase of the reverse voltage.

For example, when measuring forward power, the meter samples both voltage and current and sums the two signals. The sensed signal from the forward voltage is summed with the sensed signal from the forward current to contribute to a power reading on the meter. Also summed into the reading are the sensed signal from the reverse voltage and the sensed signal from the reverse current. Because these two particular signals are "out of phase" (opposite polarity of each other), they cancel each other out and make no contribution to the meter power reading. Thus, you are able to measure the power in a single direction despite the fact that power can actually be traveling in both directions simultaneously.

A similar second measurement is made in the opposite direction to determine the reverse power. Once both the forward and reverse power are known, the Standing Wave Ratio (SWR) can be determined. "Standing waves" are created by the interaction of forward and reverse power on the transmission line. The respective voltages and currents add constructively and destructively to create nodes of high (and low) average voltage along the transmission line and nodes of high (and low) average current along the transmission line.

The "standing wave ratio" is ratio of the highs to the lows; it is, in essence, a measurement which basically describes the ratio of forward to reflected power.

Because of the directionality of an SWR meter, at any given time, it sees only the forward signal or the reflected signal. It does not see these standing waves, or nodes, on the transmission line because they are the sum of both forward *and* reflected signals. Thus, contrary to what some claim on the newsgroup, placing the meter at a current or voltage node will *not* render an inaccurate reading.

How is "power" 180 degrees out of phase? Do you have "negative"
power reflecting down your transmission line? Do you have a power
meter where the needle moves to the left when you key up? You must
have an anti-matter antenna. ;-D

> True SWR, should be the entire systems SWR. Correct? [Thinking that

That is not the characteristic impedance.
There is nothing "characteristic" about it; that is a genuine impedance.
"Characteristic impedance" is a term used to describe the relationship
between a voltage and a current when an actual impedance does not
exist. For example, a transmission line with a characteristic impedance
of 50 ohms will carry signals (in each direction) where the relationship
between the voltage (in a given direction) and the current (in the same
direction) is V/I = 50 ohms. There is no 50 ohm resistor (or resistance)
to be found; no power is being dissipated but the relationship between
the voltage and current are as if applied to a 50 ohm load. Thus, it
is a "characteristic impedance."

Replace the R131 resistor with one half the current value. It will give
better modulation and slightly higher AM carrier wattage. Cutting R131
makes the radio over sensitive

I really like my IMAX. Its a lot easier to set up. You find better sales on it too. I got mine for $60 NEW. I have great ears and get good reports. SWR's are 1:1.7 from 25.165 to 29.655 Mhz. They stay under 1.3 up to about 28.4 Mhz. I have mine strapped to the chimney 55' in the air (no guy wires & I don't need them). It weathers better than aluminum and weights only 6 lbs.

For a typical CB radio, it is.

2835. Cobra 23 Plus - Power Mic

Newsgroup: rec.radio.cb
Date: 1999-11-16 00:00:00 UTC
From: jkittle117@my-deja.com
Message-ID: <80sepmhmm1@nnrp1.deja.com>
Source record: 11220

I am wanting to wire up a ParaDynamics Power Mic (echo and noises) to my Cobra 23 Plus (40 channel plus 3 weather bands). According to the Cobra website, they do not recommend putting a power mic on this unit. Does anyone know why? I have been having problems wireing it up to the 5-pin din connector that the radio needs. I "thought" I had it correct, but the radio would "moo" when i keyed - it gave a high pitch tone that would become low picth (imagine a bomb dropping).

Any ideas?

Ahhh, being a radio novice, I didn't realize that I was opening a can o' worms with my original post, makes me think it was a good question to ask! But, I really do appreciate all the opinions on radials for the Antron 99, both expressed here and via email.

My take on it (so far).... the Antron 99 is a decent antenna that won't break my wallet. It will be a worthy replacement for the 25 year old lightning rod currently on top of my tower. I think I will put it up and try it without radials... perhaps I will put them on later to see if they actually make a difference in my real world situation... There have been a few posters/emailers that have said they've made little or no difference when they've added them on, but it might be a fun experiment and reason to drive all the fire roads around our cabin with a mobile. If i do so, I'll make sure to post the results (and undoubtedly start another long thread in the process) ;)

thanks again,

Brent

What the hell are you talking about? You've created a completely
different scenario which has nothing to do with the question at hand.
A 50 ohm transmitter is not mismatched.

I'll spell it out for you:
1) Take your Smith chart
2) Consider a reflected signal traveling back down the transmission
line toward the radio.
3) You are using a typical CB radio with a 50 ohm output impedance.
4) Now consider what happens when that signal impinges upon the
50 ohm impedance at the radio.
5) Use your Smith chart to find the reflection coefficient for
50 ohms. Answer: 0.00

Why don't you quote me a chapter that disagrees with what I say?
It all comes from the book.

> Since there is a mismatch at the antenna - the impedance that the
> transmitter sees is not 50 ohms. The impedance that it does see
> can be calculated by formula. As the design impedance is not
> present - the finals cannot operate at designed efficiency.

Again, you are talking about the wrong impedance. We are talking
about the impedance seen by the power reflected back down the
transmission line. It sees the impedance of the transmitter which,
typically, is 50 ohms.

> The end result is the same - the finals get hot. It is just the
> mechanism is different than what you would think using simple
> logic.

Your analysis is flawed. You describe it as if no power goes up
and down the transmission line. You are using a "lumped element"
analysis for a "distributed element" system. This is a common
practice for simplifying a circuit for analysis but breaks down
under certain conditions such as this.

For example, if I transmit into an open ended transmission line
that is 1/2 wavelength long, the transmitter sees an impedance of
infinity at the coax input. Despite this infinite impedance,
current does flow into the transmission line all the way down
to the open end where it is then reflected back. This can be
proven with a power meter. I can measure power all along
the transmission line.
In fact, the transmitter would not see the infinite impedance
unless power were being reflected back.
Now, for some circuit design analysis, an infinite impedance
could be substituted for the transmission line here. But at
an infinite impedance, no current would flow. However, I can
prove that current does indeed flow because I can measure it
with a power meter. The reality is that current simultaneously
flows in both directions and the net current is zero.

Oh yes, I'll give you that. The FCC has largely ignored the CB band. However, I was still responding to the original argument that the FCC was biased against the CB band and was treating CB'ers differently (more harshly) than the operators in other bands.

> This may be changing now, but the FCC still needs a ton of money to do
> an effective enforcement, unless the burden of policing the CB band,
> falls to the local law enforcement types (I hope that NEVER happens).

I don't think the FCC wants to lose control (any control) over radio, so I expect them to make a handfull of high-profile CB busts just before any CB-related bill in congress comes up for a vote. Even if it does not change anything concerning the vote, the FCC would then be able to at least claim that it was trying.

> I think if the FCC was serious in providing a radio service for the
> citizens (In light of the relatively affordable competition from

I have not seen any movement towards creating another service. In fact, the FCC's current attitude seems to be enough is enough (as far as hobby radio is concerned).

<<It looks to me that the CBer's got a case of "You asked for it, you got it", from the FCC. Since so many people never bothered to get licensed, even when it was required, the FCC eliminated the license, and with it, any sort of protection that the license gives you from interference. The FCC could not keep up with the wave of illegals, so rather than look ineffective, they abandoned the band.>>

Which is ironic, because if the FCC and ITU were to somehow accede to Jeff's wishes and create a lawless version of ham radio from 25 to 29 MHz with no power limits, no distance limits, no rules, and no enforcement....

...the result would be that all of 25 to 29 MHz would sound exactly like "the legal 40" does now. Maybe worse. You want no rules, right? Everything legal? Every Radio Shack could feature affordable CB amps and expanded coverage CB radios in their next Christmas flyer. Your pals at Exports-R-Us could make sure that vast quantities of affordable hi-power, full-coverage radios were available to all comers. Davemade, X-Force,

Skullcracka and other competition amp suppliers could come out of hiding and offer competing lines of 5 KW, 10 KW and 30 KW amps. And because there are no rules, any 12 year old kid could run his amplified echo-box radio right on top of
your "DX Net". Sound fun? You'd better think so, because this is what you have

been arguing so vehemently for, Jeff.

Brent,

Why don't you try to get a copy of the book "The Amateur Radio
Vertical Antenna Handbook" by Capt. Paul Lee, N6PL (SK). It is
relatively inexpensive and is obtainable from CQ.

http://www.cq-amateur-radio.com/

It is about 130 pages in length and I'm sure it will answer all your
questions regarding vertical antennas without the BS.

And we've answered that question many times before, Jeff. Many of our old friends still only have CB radios, so we keep our CB around to talk to them.

> why do they have to come here and shove their views down our throats?
> if cb is so bad, why don't they abandond it for the holy grail, the ham bands?

And we've addressed this also, Jeff. None of use has ever said that CB is bad, only that there are some illegal users who make it bad for everyone else.

> if they are going to come here, if they can't help someone, don't like the
> subject matter or if they don't have anything positive to contribute, don't say
> anything at all.

When you apply those same standards to yourself, we'll follow your lead, Jeff. You're the one in here ranting about ham operators. If you can't help someone, don't like the subject matter, or don't have anything positive to contribute, don't say anything at all.

> i may not know as much as some hams but i have gone to rec.radio.amateur and
> answered some of their questions.

You know, you've said this many times. What do you want, a medal? So what? How does the fact that you have answered a few questions in rec.radio.amateur justify your continued assault on ham operators in this newsgroup?

> i didn't always get the answers that i wanted or agreed with but
> they were friendly. here, if you ask a question about amps or mods, you get
> someones keyboard shoved down your throat.

Now that should be rather obvious, Jeff. If you asked about amplifiers in the ham band, then you were asking about something that was legal (ham operators can legally use a linear). An amplifier is illegal in the CB band, so you're not going to get the same response from the ham operators here.

I'm also sure that you did not spend weeks conplaining about ham operators (like you do here) before you asked your questions in rec.radio.amateur.

> there was one poor guy here 2 weeks ago that asked a question about an amp.
> the flame thrower came out from one ham shack billowing threats of the FCC.

> if the ham would have looked at the guy's e-mail address, he would have seen
> that it ended in, ". UK".

I saw that message thread, Jeff. Yes, the question was from a guy in
the UK. He asked about linears, which he admitted was also illegal in
the UK. The CB'er with a ham license responded that he should consider
other options, such as a better antenna or better radio.

The Cb'er with a ham license only mentioned the FCC once during his
entire response. I would hardly consider that "billowing threats of the FCC."

By the way, I also noticed that YOU did not offer to help the person
asking the question. You decided to attack the CB'er with the ham
license instead. You made a big fuss about the FCC comment, but did not
contribute anything that would have helped the person asking the question.

> not all hams are like this though. even some who disagree with the alternative
> cb life style. they are either neutral or helpful on antenna, power supply or
> in non-technical issues.
> this is all we ask.

Alternative CB lifestyle?? Now I have heard everything. What's next,
Jeff? Are you going to march on Washington, hand-in-hand, demanding
equal rights for your alternative lifestyle? I imagine that it is only
a matter of time before you start claiming that you didn't CHOOSE to be
an illegal operator, you were BORN that way.

All the export radios are attempts to sell CB'ers high profit margin, poorly engineered radios easily modifiable to operate with i llegal parameters. They are horribly expensive, and cheaply made. Look for a piece of used mobile ham HF gear (real ham gear, not the "10 meter" stuff that I just described) and have a tech modify it for 11 meters. You get a well engineered product (real selectivity, real speech processing, etc...) for probably the same or less money than one of the off-shore fraud radios.

Greetings!

Whap whap!

Please re-check your references.

Voltage is detected, show me a CB radio that uses a current sense
versus the simpler and less intrusive voltage.

Waves 180 degrees out of phase occur on the shield as shield currents.
Which when compared to reflection power within the coax center strand,
the complex impedance the coax presents at the point of detection and
the outer shield currents present, may alow the detector to actually
sense LOWER effect of the reflected, due to summation, or nodal
response. Basically, the coax currents being out of phase, results in
a summation problem this is the error that makes "trim length" work
like it does.

Summation during detection.

Please re-read your work!

I'll go along with that. This is what separates the radios from the toys. Not all SSB filters are created equal. I always wondered why I could hear more people than I could talk to. I finally figured it out. They couldn't hear me! No brilliant revelation there but I realized that my reciever was better. Proved it when sitting next to a friend with a HR2510. His radio was swamped with noise & bleedover while I could hear the station clearly and work him. Also noticed my receiver was more quiet during no-skip conditions yet could hear more distant stations. Most good buddies are too concerned about power mics, getting out, noise toyz and swinging audio to notice their receivers are shit.

Greetings!

When you finally settle down, re-read. I think it's time you took a moment or two to realize are you quoting me or Bill?

My own comments are mixed in.

Better break it down.

And while you're at it, take a moment and realize that you make more headway with the wind, then against it.

Please explain why coax length doesn't matter in the CB world, and I'll show you a resonate system. Show me a CB system that needs coax trimmed to length, and I'll show you what needs to be changed.

Care to date?

;-)

AM = Ancient Modulation; Awful Mode, Antique Microphones, Audio Muddy, Absolute Mayhem

I'm sure you can think of some more. There's nothing that works very well on AM. Squelch doesn't work well 'cuz it gets falsed by noise; you need the carrier of the transmitting station to decode what they're saying; the IF bandwidth is wide and lets in all sorts of noise; the modulation envelope has a limit at 100%; any interference on the frequency will come through the speaker. Blech! If CBers were a little more organized and orderly they may have at one point had a case the lobby the government to allow other modes, and possibly other frequencies, on CB. I can't see that happening now. What I can see is licensing the band for some real' noisy commercial, scientific or industrial purpose that would wipe it out for CBers. Something like over-the-horizon radar, wind profiling, vehicle positioning, meteor scatter communications etc.

John,
You are not too detail oriented now, are you? Allow me to quote the original thread:

"Any one got any ideas how to turn up the output on a Uniden PC66XL Radio????
Email me please."

Now I sure as heck don't see the user requesting both a pubic and private (e-mail) reply. He is blatantly requesting a private e-mail. He is even courteous and polishes off the request with a "please". I think I have a flair for the obvious, John.

Also, John, I have 31 years military and commercial experience with SMTP/NNTP protocols (yes, they're that old), so I'm pretty sure I know how to use MicriSh*t Outlook to post in newsgroups. I was building and optimizing ARPANET (...and among other systems you've never heard of) before you even knew what a PC was.

Nevertheless, I refuse posts that are requesting information via private e-mail. Back to my original statement: This is a public newsgroup. Questions/requests made public should be answered public. That is what I think is fair.

73's, and don't tie up 119!

Not true no such thing as an odd amp with this design, the 4,6,8,10,12,14,16 etc all the way up all use the same type combiner every 2 pill stage gets another port, notice i didnt say 2 pill because of course no combiner is needed. So when combining 2 x 2 pill stages(4pill) a 2 port is used for that, when combining 3 x 2 pill stages(6pill) a 3 port combiner is used, when 4x 2 pill stages are combined (8 pill) then a 4 port, (10pill) 5 port, so a (12pill) would get a 6 port , and (16 pill would get a 8 port combiner) and so on. Or it could be built in 4 pill stages you would then use a 3 port combiner to combine the 3- 4 pill stages(12pill). Not sure what you were trying to say. But they do use the exact same thing,.

>Dave
>"Sandbagger"

If both sidebands were used in this manner a USB signal at 27.402
would directly interfere with a LSB signal on 27.405. So that in
keeping with this thread, the idea of multiple channels without a
full AM signal being present, we would only be able to obtain a
maximum three times the amount of channels. Spaced at 3.3KC's, or
120 closely spaced channels.

In the mini grass conditon, position make a big difference. Lots of guys hooked up to 6-8 elements beams too. Depends on which side of the island you are on. If you have nothing but water in front of you look out, if the mountains are in your face tough luck. Ask Mod Squad who built his 8 pill. He is out there with guys running much bigger stuff than him.

I would tend to agree with the amp draw crakerjack, but he can use 2 -250's on the 32 and still see good watts of course 3 or more would be much better, but I don't think he is going to get in any keydowns just yet and if he does he should could add the 3rd one, or there are many other tricks he could do like series some 12 volt batterys for 24 volts then when he keys it will naturally dip. I don't see many people who put shit in there vehicle not make changes they are always upgrading and fine tuning everything, especially with something of this size. He will learn from it

You have had enough. Good. So has everyone else. Now that you may have exhausted just about the last shred of credibility that you may have retained, there is only one way to redeem yourself and regain some credibility among these posts. That is to admit you were WRONG. We all are from time to time. But if you refuse to believe that type of DXing is possible(it is, was, and will contiue to be) despite the amount of operators that have refuted your claims, and cannot admit you are wrong, then you might as well come incognito 'cause anyone who knows a thing about radio is going to ignore anything you may have to say. Or read it as the joke of the day.

Good Info... Thanks.

I'll try to compile all the info and come up with a step-by-step process for the Mods.

Sounds as if this beast of a radio is one of the most difficult to properly modify.
Good think I waited for the input of this group.

I would conclude that the ST must be taken care of prior to mods.
Too bad it was useful to pull in weak AM. (Horrible for SSB).

I'll wait a few more days until the posts stop, then make the mods.

Sure do wish I could pass the game plan by someone prior to committing.

One additional point. Maximum legal height for an 11 meter antenna is 60
feet above ground.

If that antenna has been up there that long with the same coax, it's
time to replace the coax. If the antenna is still bad after you replace
the coax, then replace it. A friend and I put an antenna along a trail
in the woods. When we get some new working coax, we'll try it again.
(I hate SWR above 3!)

2893. New Radio Review... President James

Newsgroup: rec.radio.cb
Date: 1999-11-16 00:00:00 UTC
From: Toll Free <tollfree@bigradios.com>
Message-ID: <mUnY3.16346$Ph7.120096@insync>
Source record: 11278

Got a new radio to play with today. Actually, it has been on the market for quite a while, but nobody I have talked to stateside has EVER seen one.

It is a model President James, 240 (26.065 to 28.755) Channel AM / FM unit. Very similar to the President George in that the unlock codes are the same. The modification to get it up and running on all 240 channels was a breeze, and easily found on the internet.

Hooking it up on the bench, I see stock out of it just as President advertises.... 2 watts to 8 watts variable key (both AM and FM), and 100 percent modulation wherever you set the carrier. This works out to nearly 25 watts PEP on all the way up, and slightly less than 10 watts PEP with the carrier control all the way down.

RX section was good.. Very good sensitivity, however, I did notice one quirk... When on the A band, on channel 5, I could hear 27.025 the same as if I was on 27.025. Not harmonically related, but plain as day. Could be a quirk, or could be something related to my setup. Not sure, and didn't really play with it long enough to see if it was due to being cold or something similar.

After doing a slight tune-up on the bench, the radio really came alive... I could set the carrier as low as 1 watt, and up to 18 watts. When set to 18 watts, it would hold 100 percent modulation, and swung to a rock solid 50 watts!

Low power (amc defeated, variable turned up all the way) I was able to see 1 watt swinging to 35 watts! This is a low level modulated radio, and I will be the first to say that I was VERY skeptical because of this, but as in the George, it sounds great! However, unless you run near 4 watts of carrier (like a Galaxy), it sounds distorted on AM.

Their are separate power controls (internal) for AM and FM, so you can set the am section of the transmitter up to do exactly what you want, then crank up the FM section for even more power output. FM works great, as well.

I set mine up to do 10 watts of carrier and swing to 28. This seemed to sound the best, and corresponds to 100 percent modulation (or nearly so).

Radio has a roger beep (which is QUITE low in frequency... Sounds very distinct), reverb (they call it echo) that is quite pleasing.. Sounds like someone in a grocery store when their is nobody in it at night. This is variable, but I left mine where it was when I got the radio.

For metering, it is the standard Uniden 90s model LED display... Ala Pro 610e. Looks good, and you can make out what it is saying. Includes Mod, S/RF and SWR.

Radio does scanning both in memory channels (unfortunately, their are only 4, but they do hold frequency and mode) as well as band scan. I was unable to test the bandscan because of the high level of skip in tonight. Maybe next time.

Radio has dual lighting, green and orange.. Guess Alpine and Kenwood got their standards even in the CB market! ;-)

Anyway, this looks to be a good radio. I am happy with it, and will keep it and use it, rather than stuff it in the closet where most of the other "export" radios are sitting. I haven't ever seen one in the states, and neither has anyone else that I talked to. I picked it up via auction on E-Bay, so it was used, but I am happy with both the deal and the radio.

If anyone else has questions, feel free to ask.

25 watts has gotten me to the Falklands, Japan, Australia on 10 meters,
I did work the S.Pole station KC4AAA. All is possible with an opening.
However, China has just allowed Amateur Radio, the transmitters are kept
at club locations but htere is talk of allowing home base sets. Comms
are very tightly controlled. Remember the square?

2896. WTB: REGENCY RANGE GAIN II

Newsgroup: rec.radio.cb
Date: 1999-11-16 00:00:00 UTC
From: Bruce <skynite@email.msn.com>
Message-ID: <ee7t4QKM$GA.287@cpmsnbbsa03>
Source record: 11281

Hi,
I am looking for a mint condition Regency Range Gain II 23 channel tube CB transceiver. Would prefer the original mic and manual. Will pay good price for such a radio , box would be a real plus!
Email me if you have one of this description.
Thanks
Bruce

>Danny

The ground radials chief function is to help decouple the antenna
from the coax.
A typical end fed half wave mounted one wavelength high over
average ground will have 3.09dbi at a 24 degree takeoff angle.
Adding four quarter wave drooping ground radials will take this
same antenna to 3.47dbi at the same takeoff angle

O.K.

Mine runs at 16.5 day to day, and I have rolled it up to nearly 20 before.

Last time it blew, I was at 24+ volts, but that was because the regulator
failed and the alternator went full field.

So, either I am a mudduck, or he hears people coming back to me all the time.

One way or the other, you can't have your cake and eat it too...

If you want to hear me, listen at 11:30 to 12:30 CST for lunchtime skip, then again at 4:00 to 5:00 in the afternoon, CST, for the skip on the way home.

I am out their a grand total of 2 hours a day, unless I stay out because I am having fun, or because their is nothing else to do.

Still, if you hear people coming back to me, how can I be a duck?

One way, or the other.

What I was trying to say is that you would not use a 2 pill combiner to run a 12 pill box on.

It is hard enough to get the balancing right on a two port combiner to where you are not burning up resistors, and most amp builders cannot get that right.

Dave and Cookie seem to do it right, so they have decent boxes for running "odd" sizes of pills in.

Still, you need to run the correct amount of drive into them, and then you are stuck with running odd pilled amps.

It seems easier to me to run a even number of transistors, then when SOMETHING does go wrong, the local idiot can fix them, rather than having to send them back to the manufacturer because he is one of about 10 people in the US that can understand how a port combiner / splitter REALLY works!

2910. Re: Conflicting stories of Mods for the 148 GTL - ST

Newsgroup: rec.radio.cb
Date: 1999-11-16 00:00:00 UTC
From: Hank Aaron <REMOVEjeffherrings@hotmail.com>
Message-ID: <80t91r$3sv$1@nntp6.atl.mindspring.net>
Source record: 11295

Okay. I didn't think the ST's were any longer an issue, since I am not a genius (I pretend I am to myself though) I thought this information was old news. I apologize for not contributing earlier:

25WST
Remove C809 and C819. Short pins 1 & 2 of IC802.

29WST
Remove C821 and C809. Short pins 1 & 2 of IC802.

29LTD-NH
Remove C809. Cut trace between IC801 pin 10, and IC802 pin 4. Short pins 1 & 2 of IC802.

148GTL-ST
Remove C35 and C16. Short pins 3 & 5 of the connector on the channel selector PCB.

I believe I go them in order. I'll help where I can, just email me.

Hank

the receiving radio will only accept so much deveation (misspelled) and will clip it... thus making your signal break up....

Jack when are you going to learn. Collinear in the dictionary
simply means in line.

In the antenna world it's a little more complex. It means at least two
half wave elements are in-line, and are fed in phase.

You use the simple definition. Why?......I'd love to answer that but
I will leave that for someone else.

Just answer this. Why is the A99 advertised as a 9.9dbi antenna
in CB publications and also advertised as a 3dbi antenna in Amateur
publications? Is it that much more effective at 27mhz?

Ok, I'm gonna repeat myself here. Some time ago I wrote this NG
that I was in fact the guy that gave the ground plane kit to all of
you. Naturally, I don't claim to have invented ground plane radials
but I did in fact give this idea to a certain manufacturer and they
ran with it until you have what you have now.
The radials I had made were to answer a small tvi problem a
customer of ours had. I figured I knew why the Antron was doing it
and thought the problem could be abated, or nearly so,with some
decoupling. I also thought maybe a small change in pattern would
also help get more range locally.
In this particular case I was correct. I minimized the tvi /
phone rfi issue for my customer and he also found a slight
improvement in his local coverage into certain areas.
Not unlike Dr. Freud's couch, these ground plane radials were
never meant to be a business unto themselves.
In explaining this before, I said not everyone would notice the
improvement in range or tvi reduction. The change in pattern is
subtle in most cases and would only be noticed by gaining an ability
to talk a little better into areas that were beforehand very
marginal. These kits were not what you'd call "a linear in a
box,,,just add water".
I also explained that most of today's halfwave or bigger
antennas did not absolutely require a gpkit as the halfwave has the
proper current distributions already.
So for those that tout the groundplane kits as the end-all
be-all of antenna accessories...forget it.
For those of you trying to call it a hoax..you can forget that too.
There is a purpose to them other than a gimmick and money.
As for me? I forgot it too 'cause I never did get even a thank
you from any of those manufacturers who picked up on this and went
with it. Next time I'll be a bit more careful of what ideas I give
out.
Bob C

Dearest Dwight,

I'm half wondering if you are trawling for flames on this one. I assure you it is possible to work the world on very modest equipment on 11m. I have spoken from this continent to Asia and the Pacific rim many times. And I've done it with, dare I say it, legal equipment. I've spoken to Australia and Japan on several occaisions. I do admit that I have never spoken to China nor Antarctica though. I don't even know if China has many CBs. Most people there are saving up for a new bicycle, not a CB radio! And most people in Antarctica (all 27 of them) are probably busy working on scientific research anyway.

MC

Greetings!

Good points Bob.

This subject of trimming gets way too complex for the average CB'er
and may hinder their development.

As I dabble in this stuff, most of what I've learned isn't going to do
the average Joe a d*mn bit of good aside for the obvious.

Life around a CB should never be difficult. Some people seems to argue
finer points when the whole outlook is simple.

"They focus too much on the tree and not enough on the forest around
it" - it's a good motto, and the whole threaded mess fits it.

I'll always say that if it works for you, then use it.

If performance doesn't seem to be like it should, then let's talk.

I don't know how I got dragged into this mess, except to defend the
special considerations that require such a technique.

When people use 18' just for their own reasons, then I'd prefer to
leave them to their desire.

Besides, if they only needed 12-14 feet to reach the radio, and the
connections are pre-molded, and soldered - why bother trimming up the
excess just to look good?

My asked questions' have always been, "No, it works fine
just like it is. You can leave it alone."

You don't obtain any extra "gain" from removing 4 feet.

You may suffer problems with a poor connection later on,
because you had to re-do a connection.

A proper location, good mount, and soldered and sealed
connectors always provide support so you don't have to
concern yourself if you have an "Apparent" or "True" SWR
problem.

The CB'er would rather worry about other things,
they may not all have PhD's in Physics.
They don't need one. ;-)

I'd rather seem them happy with what they have.

When problems *do* arise, I'd like to be there to help.

While Dancing with the Mouse on Sun, 14 Nov 1999 22:57:45 -0500, the
Modem interrupted with an MNI from "Bob <bob@bob.com>", and the
MotherBoard buffered this to Video RAM:

Howdy Bill,

I disagree. (ducking) You could attach 6' radials to a CB antenna and improve the performance. However, that antenna would have to be specifically designed for them - the A99 isn't. Nor is any antenna I've seen lately come to think of it.....

MC

Removing R131 will make the radio overmodulate. So leave the radio screwed together and go play with something else. There's a good boy.....

Take the microphone back to the store and get your money back. Not that there's anything wrong with it, but I'm sick of noise toyz on the air.

If Cobra says that you shouldn't use a power microphone on the radio it is because they've engineered it not to need one. Sounds wild, but the people who design the radios actually know more than the CBers who buy them.

If the microphone that came with the radio isn't adequate, I suggest you take it too back to the store and demand your money back. Tell 'em that a guy calling himself MC 10kW Jesus said so. That oughtta carry a lot of weight.... :->

Greetings!

Thank you. I thought there was few more parts, but you are correct.

My memory needs post-it note pads!

Too bad I fixed and gave it back, it's the one I had the headaches
over. I remember them asking to have it defeated and do some work.
After jumpering the ST switch I set about working on it, I know
theres' some other stuff that these two caps address, but the radio is
back in their hands. And they like the work. So, I'm sure someone else
will get their fingers in it and post some more mods out here soon.

I just wish I remembered more of that had to be done. I do remember it
took the mods rather well. Mostly modulation and some re-work of the
driver/final section, and it was up to snuff and good enough!

4 months and a Divroce does that to people...sigh...

While Dancing with the Mouse on Mon, 15 Nov 1999 19:28:15 -0500, the

Greetings!

I thought those silly little radials were for decoupling coax so you
didn't have to wind an extra 8 turns or so further down the mast to
reduce coax currents.

Whats up?

While Dancing with the Mouse on 16 Nov 1999 05:55:31 GMT, the Modem

Body handling: HTML body converted to readable text

Greetings!

Check your options and make sure you use UUencode, most Newsreaders tolerate MIME - it just shows extra garbage. You might want to disable the HTML formatting too.

You'll see "=" signs at the end of your lines, this is so that MIME readers don't "truncate" and CR+LF - instead it "wraps". Otherwise we see "=20" as an (esc) sequence.

Some ISP servers don't filter that, e.g. - like AOL. At least they don't re-format for their own users, instead they pass thru. Problem is with literal strings and how they're interpeted. Some routers will re-format the message so it's viewable - albeit full of extras, for both types of encoding.

Those that use UUencode see a double message.

UUencode? WYSIWYG - and you set the default font for your own eyes.

Just wanted to let you know what we were seeing.

Greetings!

Uh oh...

This radio, I believe, if you see 5-pin DIN, it's usually a Condeser element type that takes power from the radio.

"Moo"? Well, <chuckle> thats a good way to put it.

It powers the element. And also sends audio down the same line. It's decoupled from the bias circuit inside, but many dynamic or power mikes can't tolerate this type of setup. It'll squeal, or place a voltage on the line that will muddy your audio because it's charging a cap that is used to block DC voltages from getting into the mike and affecting it.

While Dancing with the Mouse on Tue, 16 Nov 1999 20:28:47 GMT, the Modem interrupted with an MNI from "jkittle117@my-deja.com", and the MotherBoard buffered this to Video RAM:

Hmmm....well, it'll guarantee best performance of your VSWR meter. :->

> You seem to miss the point that the impedance of the load
> the finals "sees" DOES NOT have anything to do with SWR. The real
> mismatch condition occurs at the antenna feedpoint -
> like I have said 10 million times. Try thinking for yourself.
>

Perhaps a poor choice of words on my part. I am not in disagreement with you about VSWR. I agree that the length of feedline does not affect the VSWR of the antenna. The point I was making is that you never really know what your antenna's VSWR is if your feedline is anything other than an electrical half-wave when your antenna is other than 50 Ohms (which all quarter waves are). The exception being a 1/4 wave with angled-down ground planes. Once you've removed the coax variable from the equation, as only a half wave will do, you can focus on pruning your stinger for the 1.3:1 VSWR.

Now if you'll excuse me I must go play with my stinger. :->

2940. Re: Conflicting stories of Mods for the 148 GTL - ST

Newsgroup: rec.radio.cb
Date: 1999-11-17 00:00:00 UTC
From: CodysPC@Iserve.Net
Message-ID: <38320373.7667213@news.iserv.net>
Source record: 11325

Greetings!

It was just a bear. Once you we're able to make it work straight forward, it performed like all the other radios.

The thing I liked about ST, which led me into this mess with the radio I got to work on, was it's novel use of a compandor. To dis-able the ST, I just jumpered at first, then payed attention to what it was doing.

...what seemed like hundereds of hours later and constant references to electronic references in "Audio sections"...

... I finally came to a concussion, er-conclusion, that ST for what it is, needs to be made "Globally" implemented for it to really work like it should for others to hear the benefit. Too bad the FCC didn't allow for a PL to be broadcast so that these ST radios could have the full benefit of detecting the PL and engaging during such a transmission from another ST radio to hear the true benefit.

I actually had two ST-models, one a Cobra 29, and one the 148.

The 29 I simply re-overhauled, fixed the ST and sold it at a local Flea market.

I actually lost money on it. It cost me 5 bucks at a Garage sale, but after all the work I put into the '29, I only got 30 bucks. This radio was the one I originally got, and had to re-connect the ST feature to make it work. [Or at least undo what they did, and re-create the original and then fix that.]

Once I got the '29 working, the 148 came into play. It still has the ST circuits intact, only bypassed. They use the ST button for a channel jump switch.

But, to give credit, the joy of ST was the "expansion" after it got into the other receivers' ST. Very good fidelity, but sounded a lot "flatter" on another radio that didn't have ST.

This is the reason why ST is such a bane. It sounds great when two radios use it, but terrible on other radios not equipped for decoding it.

As far as mods? Well, be conservative at first. Don't go all out for doing it all at once. Take your time and use the radio in-between mods This way, if someone complains, you only need to re-do one mod, and not have to re-fix everything else.

Believe me, I've been there.

While Dancing with the Mouse on Tue, 16 Nov 1999 20:06:03 -0500, the

Thank you get some! I known the box will run on two alts and I know it will run better with more alts. Your right I most likely wont be in any keydowns unless some mud ducks around me want to give it a try. Since there arent many mobles bigger then 16 pills by me I dont see it happening. All I want to be able to do is talk and be heard with a fairly strong signal. That is what I promise I will do.

: > : power reflected into the transmitter.
: >
: > Read a text on transmission line theory - rather than going by
: > popular belief.
:
: Why don't you quote me a chapter that disagrees with what I say?
: It all comes from the book.

The heating is a consequence of the mismatch - true. We just are
in disagreement about the actual cause.

Radio Amateur's Handbook (1983 edition - since that is what I have
handy):

"Quite often, it is mistakenly assumed that power reflected from a
load represents power "lost" in some way. This is only true if
there is considerable loss in the line itself and the power is
dissipated on the way back to the source." (Page 19-2)

That is what I found with a quick search. There is probably more,
but it is not as easy to find in the newer handbooks than the old.

My references from my Transmission Line Theory classes are in a
box somewhere, or I would haul them out to quote "chapter and verse".
They are all VERY explicit on the matter.

My apologies for not being able to document this more completely.
The whole subject is counter-intuitive.

: > The end result is the same - the finals get hot. It is just the
: > mechanism is different than what you would think using simple
: > logic.
:
: Your analysis is flawed. You describe it as if no power goes up
: and down the transmission line. You are using a "lumped element"
: analysis for a "distributed element" system. This is a common
: practice for simplifying a circuit for analysis but breaks down
: under certain conditions such as this.

Nope. Although lumped elements would give the same result, it is
not necessary to assume them.

The only way you could assume lumped elements would be to model
the transmission line with resistors, inductors and capacitors.
So the resistance would NOT be connected at the transmitter output,
and the transmitter would not see an infinite impedance.

: For example, if I transmit into an open ended transmission line
: that is 1/2 wavelength long, the transmitter sees an impedance of
: infinity at the coax input. Despite this infinite impedance,
: current does flow into the transmission line all the way down
: to the open end where it is then reflected back. This can be
: proven with a power meter. I can measure power all along
: the transmission line.

: In fact, the transmitter would not see the infinite impedance
: unless power were being reflected back.

On the other hand - if the coax is long enough - then you will
not see all the power back at the transmitter - even though all
of it is reflected.

: Now, for some circuit design analysis, an infinite impedance
: could be substituted for the transmission line here. But at
: an infinite impedance, no current would flow. However, I can
: prove that current does indeed flow because I can measure it
: with a power meter. The reality is that current simultaneously
: flows in both directions and the net current is zero.

Well, the net current is not zero - but close to it for relatively
short lengths of low loss transmission line. So what?

As a simple illustration. Assume that you have a length of coax with
3 dB loss for that length (cut to a multiple of 1/2 wavelength). If
you feed 100 watts into the coax - only 50 watts appear at the open
end, where it is all reflected. When that power gets back to the
transmitter, it is down to 25 watts. Instead of your meter at the
transmitter reading an infinite VSWR, it reads about 3:1.

Nowhere, but at the open end, will you get an infinite VSWR reading.

Exactly. The proper method for a round table is for everyone to tune their transmit to ONE station. Now everyone but the one station can use their receive clarifier to make them all sound right - if one does, then all will. The "One" station now tunes his transmitter so he sounds right to the other stations, then retunes his receive clarifier to make everyone else sound right.

2959. Re: Petition Filed With FCC

Newsgroup: rec.radio.cb
Date: 1999-11-17 00:00:00 UTC
From: Green Dragon <nunya@business.com>
Message-ID: <3832625d.0@monster.zebra.net>
Source record: 11344

1. Why in the world would I want to talk up there? In my area, 2 meters is full of snobby holier than thou types who think they're God's gift to radio. They were actually planning to go into a neighborhood where one of my CB friends is (who runs no power by the way, doesn't need to, has a set of stacked maco laser 400's on top of 90' tower) and deliberately create interferance on the neighborhood TV's and such so that they could get the guy in trouble. As I left I asked them why they would want to frame a guy like that. The apparent spokesman for the group responded with a laugh "Because we can." Of course I warned every CBer I knew.

2. The general atmosphere on the ham bands I've listened to is stuffy and boring.

3. I prefer to avoid having my name, address, and such posted where anyone with a scanner and an internet connection can hear me on the air, write down my callsign, and look me up for whatever purposes they might have. It's easy enough to get info on people as it is. I have no intention on making it any easier.

4. On CB the vast majority of people are friendly, helpful, and considerate. If someone thinks your radio sounds off or something they'll tell ya and will gladly offer any assistance they can to help get it right. The other night a dude that frequents 2 meters came down to CB and started telling people that their radios sounded strange. When I or one of the others asked what was strange about it (heck, if my stuff isn't working right I want to know what the deal is so I can either fix it myself or give a good description to the local tech if the repair is beyond my skill) he refused to say. He said he'd only help with such if we paid him $$$. What's up with that? After a little playing around we determined that the problem wasn't in any of our radios, he was actually 4 kc's off frequency. I have an external freq counter so I know I am on freq, yet, to pull him in clearly we had to tune down 4kc's. We told him this and he left the channel. I guess he was shamed.

The point I'm trying to make is this. In this part of Alabama, most of the hams are basically CB rejects. They didn't have the social skills to operate in a friendly manner so in an attempt to set themselves above those with whom they weren't able to interact with due to those weak social skills they went out and got a ham license. Now on the rare occaisions they show thier faces on CB they act like radio gods or something. Why would I want to hang with those people? I'm perfectly happy to talk to the people who are on CB. Even those who have king of the hill syndrome with the megawatt amps and such are basically good folks. I'll choose good folks to hang out with over assholes any day.

>

That wasn't the reason for the post. That was a response to a question. I didn't care to get the sensitivity down. It has its purpose. That is what I was trying to point out. Since I run a shop I do know that.
The people that use the radio are now prepared for it. Some will buy it and be unhappy. Since this shop does everything with schematics instead of lucky guesses we choose not to pick a pot or diode or resister and turn, clip or snip. I was just informing a prospective buyer of the close limitations of the radio. Thank you for your question.

Exactly NOT. Anytime a tuner has separate controls for TX
and RX it opens the door for all sorts of (hows that?), (is that any
better?) ect.ect. If you added multiple radios that all have separate
TX and RX capabilities and put them in a roundtable then what do we
get? We get a absolute guarantee of what the topic of conversation
is going to be.
RF tag is best eliminated by locking a receiver and transmitter
together. Then when you adjust your receiver to some ones
signal you automatically put your transmit in line also. End of
tag.

Hello Group,

I have a Uniden Madison base that is very clean, and in good to excellent condition that I have decided to put up for sale. It is one of the last models Uniden manufactured with the "digital clock", and also has the external speaker. Everything works on this unit including the clock, meters, lights, etc. It also has "extra channels" and talks very loud. I will be listing it on EBAY sometime during the next week, but wanted to offer it to someone n the group first. I am asking $150 plus shipping (which should be around $10).

Drop me an email if interested :-)

Ok, I see what you're getting at. As long as we have 6 Khz "channels",
you can have a USB and an LSB signal on the same channel, since they
fall on either side of the "center" of the channel.

If we were to make channels 3 Khz wide, then yes, you could only have
one mode on each.

Actually, there is no real reason to have both SSB modes, if you do 3
Khz channels, there is no advantage to it. Having both sidebands was a
good way of "channel doubling" our current 6 Khz channels.

If the mod is done right, I've never seen a situation where the receive frequency and transmit frequency are not synchronized. Like you said, the voltage reference is the most important point.

But what usually happens, that causes clarifier "walking" across the channel, is that people have their own "fidelity preference". One guy may like the sound a little higher pitched than another guy. Some guys are alwyas "touching up" the sound, and end up making the other guy readjust for his preference, and the cycle continues.

The ideal situation is to have a synchronized main clarifier, with a RX only fine clarifier for "audio preference tuning". The RX-only clarifier MUST be adjusted to be precisely synchronized with the TX in the center slot position, or else initial tuning will be difficult.

I agree. Initially, at least, you need the ability to "net" everyone
together onto the same frequency. Afterward, you could shift the RX to
"touch up" the other stations' sound, to match your desired fidelity.

Considering the wide variation in frequency counter accuracy, and radio
tuning, it is virtually impossible to "synchronize" a TX frequency
adjustment to another station, without their feedback.

Funny, in my area, 2 meters is populated by people who have "normal"
conversations. If the fact that they are unreceptive to "CB-type"
banter, makes them "snobby", then I'm snobby too, since I don't like "CB
Banter" on ham or CB radio. We'd like 2 meters to remain clean and free
from show-off types, that are only interested in (trying to) impressing
people.

Most hams that I know, couldn't care less what's happening on CB radio,
and most don't even own CB equipment, unless they also use CB radio. The
only time that they become concerned with CBers, is when they cause
interference. If those guys did what they did, just for the heck of it,
then they are just as bad as the worst of the CBers.

Only people with paranoid tendancies have a problem with this. If you
have nothing to hide, then you should have nothing to fear.

>
> 4. On CB the vast majority of people are friendly, helpful, and considerate.

In my area, the helpful people are few and far between (Unless you need
a lesson in vulgarity, then they are VERY "helpful"). Considerate?

That's a joke. Maybe if they like you, they'll let you talk on "their"
channel.

> If someone thinks your radio sounds off or something they'll tell ya and will
> gladly offer any assistance they can to help get it right.

It's true that there is never a shortage of opinions, when it comes to
on-air diagnosis. The problem is that most of the "helpful ears" don't
have a clue as to what they are listening to. I've heard people tell
guys with ailing radios, that they are "off frequency" when the problem
was clearly one of excessive transmitter FMing. Warbling on SSB was
written off as a "bad mike" etc etc. When you run on a band where the
majority of operators are technically illiterate, or worse, know just
enough to get in trouble, you can't trust the "advice" that you get.

What I want to know is how do you guys know who the hams are? Do these
guys break on the channel and announce that they are hams? Or do you
like to keep a dossier on every ham in the area?

Personally, I wouldn't know who the hams are on CB, in my area(unless I
knew them personally). They sound the same. I could make an assumption
that the more knowlegable or less obnoixious ones MIGHT be hams, but it
would only be an assumption.

>

So let me get this straight, if I read you right. You're saying that
certain people could not cut it with CBers, yet they were able to fit in
in the ranks of hams? Sounds a bit backwards to me. To get along on CB,
all you need are the social skills of "He-Haw", and a bunch of like
minded people. If, as you've perported, hams are "stuffy", it seems to
me that you would need a much more refined social skill set to get along

there.

I guess it the same reasoning that makes parents "un-cool" to their teenaged children. Reserved, sensible, logical, and responsible, have no place in party city.....

It depends. If you are using a power mike to increase the audio sensitivity, or to make up for a lack of gain in the FM modulator, then they are fine.

Keep in mind that most quality FM radios have the equivilent of a "modulation limiter" to keep the deviation from exceeding the max level (usually between 3 and 5 Khz). If the stock mike can fully modulate the radio, then any extra audio from a power mike will be wasted.

Desk type mike often have better tonal quality than handheld mikes, and they are often amplified as well. If the gain is set properly, they can be used with no problem. Although, from personal experience, the D104, is usually to tinny sounding on FM. One of the older Turner desk mikes tend to sound better.

> Is this true?

No. Assuming that you are using 50 ohm coax and know it's length and velocity factor, you can measure the complex impedance with an antenna analyzer and calculate the actual antenna impedance on your Smith Chart. The easiest way for most is to just use 1./2 wavelength of coax, taking velocity factor into account.

yes, and it is hard to see.....I'm at home right now and not in the shop so I'm guessing.....radio front faceing you, parts side up, about 2 inches up and about 2 inches over from the right side. its a small 1/8 watt resistor, lays flat on the board.

It will do ok as is. It will do slightly better with the decoupling radials. As they reduce the rf on the shield of the coax. But 6 ft long??? Kinda weird... I've never seen the ads, or had one, but I've always considered the antenna a 1/2 wave vertical, center fed, and the radials a decoupling section. It is a decent antenna, but not a miracle worker as some of the gain reports would suggest. MK

I agree.

Remember that the SWR measurement is fundamentally a measurement of the reflected power versus the forward power. Try not to let the nodes, waves and other terminology confuse the issue.

Except for transmission line losses, which are usually relatively minor, the power in your transmission line at your radio will be the same as it is in the transmission line up at the antenna. There is really no need to measure the SWR at the antenna.

That is a correct statement and it doesn't disagree with anything that
I have said.

Power reflected from a load is, indeed, not necessarily lost.
Hoever, if this reflected power impinges upon a 50 ohm impedance
(the typical output impedance of a CB radio), it is dissipated and
lost as heat. The only way to salvage this reflected power is to
re-reflect it back to the antenna. This must be done by presenting
the reflected power with some other impedance (e.g. with an antenna
tuner or by retuning the transmitter output circuitry). The ideal
impedance where 100% re-reflection occurs is the complex conjugate
of the impedance seen looking into the radio end of the transmission
line.

> Well, the net current is not zero - but close to it for relatively
> short lengths of low loss transmission line. So what?

You seem to treat it as if no current flows (what you get with a
lumped circuit analysis), but it does. It can be shown with a power
meter that power does go up and down the tranmission line.

You say that the transmitter is merely operating "less efficiently"
as if the power never gets out of the radio. There may be no net
power flow but full power does indeed go all the way up the
transmission line and back into the transmitter.

> As a simple illustration. Assume that you have a length of coax with

> transmitter reading an infinite VSWR, it reads about 3:1.

Yes. No argument here. I think you're getting off track here.
For this example, the difference of opinion is in what happens to
that 25 watts that gets back to the transmitter. For a transmitter
with a 50 ohm output impedance, the 25 watts is terminated and
dissipated as heat (not re-reflected).

> Nowhere, but at the open end, will you get an infinite VSWR reading.

Yes, for your lossy example. I was using a lossless scenario
because I didn't feel that transmission line loss was necessary for
my point.

<<<Why in the world would I want to talk up there? In my area, 2 meters is full of snobby holier than thou types who think they're God's gift to radio.>>>

Here in So Cal some of the repeaters border on sounding like CB. Maybe you'd feel more comfortable here.

<<They were actually planning to go into a neighborhood where one of my CB friends
is (who runs no power by the way, doesn't need to, has a set of stacked maco laser 400's on top of 90' tower) and deliberately create interferance on the neighborhood TV's and such so that they could get the guy in trouble. As I left
I asked them why they would want to frame a guy like that. The apparent spokesman for the group responded with a laugh "Because we can." Of course I warned every CBer I knew.>>>

Hey, that's pretty reprehensible. If you know who these hams are and when, where, and what frequency they plan to 'create interference on', why not gather

some evidence of their wrongdoing and lodge a formal complaint with the FCC? Send a copy to the ARRL and your local police. Forward it in email form to Riley Hollingsworth. Call the local newspaper and bend the editors ear. Instead of using this incident to "prove" that hams can be bad, too, DO SOMETHING TO SOLVE THE PROBLEM.

<<2. The general atmosphere on the ham bands I've listened to is stuffy and boring.>>

Yes, normal conversations where one person takes a turn speaking while the other one listens. It must be incredibly boring for you.

<<3. I prefer to avoid having my name, address, and such posted where anyone with
a scanner and an internet connection can hear me on the air, write down my callsign, and look me up for whatever purposes they might have. It's easy enough to get info on people as it is. I have no intention on making it any easier.>>

Anonymnity lets you avoid being accountable for your actions.

<<4. On CB the vast majority of people are friendly, helpful, and considerate. If someone thinks your radio sounds off or something they'll tell ya and will gladly offer any assistance they can to help get it right. The other night a dude that frequents 2 meters came down to CB and started telling people that their radios sounded strange. When I or one of the others asked what was strange about it (heck, if my stuff isn't working right I want to know what the deal is so I can either fix it myself or give a good description to the local

tech if the repair is beyond my skill) he refused to say. He said he'd only help with such if we paid him $$$. What's up with that? After a little playing
around we determined that the problem wasn't in any of our radios, he was actually 4 kc's off frequency. I have an external freq counter so I know I am on freq, yet, to pull him in clearly we had to tune down 4kc's. We told him this and he left the channel. I guess he was shamed.>>>

I am curious, do these hams give call letters when they come on CB?

<<The point I'm trying to make is this. In this part of Alabama, most of the hams
are basically CB rejects. They didn't have the social skills to operate in a friendly manner so in an attempt to set themselves above those with whom they weren't able to interact with due to those weak social skills they went out and got a ham license. Now on the rare occaisions they show thier faces on CB they act like radio gods or something. Why would I want to hang with those people? I'm perfectly happy to talk to the people who are on CB. Even those who have king of the hill syndrome with the megawatt amps and such are basically good folks. I'll choose good folks to hang out with over assholes any day.>>>

Well, once a misfit, always a misfit, license or no. Here's a troubling trend I

see lately: a CB'er gets sick and tired of 11 meters (for whatever reasons) and
makes the effort to acquire a Tech license. But when faced with the study and code skills required to move to the next step, they lose steam and give up. They
go back to 11 meters and/or become freebanders. Every once in a while they get into an argument on the air and they attempt to bolster their opinions by announcing that they are a licensed ham. Sad.

Anyhow, what's the point of your post? If you are comfortable on CB and it works for
you then that's terrific. Nobody here is trying to force you to change or put you down
because you choose CB. My remarks were addressed to one who felt that the FCC needs to create a lawless version of ham radio on 11 meters.

Yes, that 1/2 wave thing might help with some impedance sensitive SWR meters,
and the MFJ 259b really makes life easy-- one of MFJ's better products. If I
had to make all SWR measurements at the antenna, I think I'd pick another
hobby.

I have to agree on this one. I owned the Galaxy Saturn Turbo Base, and it
never did even come close to my old Tempo 1, which I bought for $100. I also
bought a Yeseau FT-101 EE for $200, and it also performed better than any
Galaxy I ever owned.

The law empowering local law enforcement is listed in the FCC Code. Check the FCC Website, and search for it. It does exist, and I used it to shut down a base station in Rialto, Calif. Few people know this is possible. I will attempt to get you the regulation reference. I had to provide it to my local police in order to get their cooperation.

I think it is 65 feet, but only if the structure is erected for that purpose.
The antenna can be 20ft above a structure is the purpose of the structure is
not that of supporting an antenna. For example, if an apartment building were
twelve stories high, and you wanted to mount the antenna on the roof, it could
be legally 20 ft higher than the building.

I just had another thought about your situation. Wow two thoughts in 1 week :)

You have a 3' antenna mounted in close, parallel proximity to another 1.5'-2' piece of metal. The actual window frame could be absorbing a good deal of your signal and greatly attenuating it.

```
!
!
!
! [
! [
! [
! [
!=[
```

Hmmmm, looks like a J-Pole type antenna situation. I wonder exactly what this is doing to the effeciency of your antenna. The greatest amount of signal is radiated from the base of your antenna. Directly into your windshield frame.

I mounted all my antennas on the rear of my Wranger. (HF multiband) is on a 90 degree mount off the tailgate bolted with the center tire carrier bolt. 2M 5/8 whip is mounted with the same type 90 degree mount bolted to the right rear as high above the tail light assembly as practical. A friend of mine, an Army Staff Sargent, told me that the Army has a 4' rule for mounting antennas, they must e seperated by 4 feet horizontally. I am thinking about moving my HF antenna to the left side, but right now I am pretty happy with performance.

Take this with a grain of salt, as I am only theorizing in print... I would welcome any other comments.

> > there have the service manual or schematic of this little rig for sale?

The HTX100 uses the same filter for SSB and CW. What is different is
the offset of the carrier oscillator and LO, to place the signal at a
different point in the passband. You could change the carrier
oscillator offset to place the passband differently, but this would
result in inaccurate dial readings because the LO offset is switched by
the CPU. If you are having that much trouble, perhaps your CW carrier
oscillator adjustment is misaligned. I've got the service manual at
home; send me private mail if you need the alignment spec.

Well, a program to use your computer for a CB is news to me. You would most certainly have to have some kind of hardware to go with the program. This is simply because the computer alone does not have any of the necessary circuitry. Perhaps the person who told you this is mistaken, and referred a program that INTEGRATES a CB with your computer. That I have seen, and is pretty "neat" if you like to have "neat" things.

Stephen wrote in message <8105co$cl0$1@Usenet.Logical.NET>...
:I was sitting at the computer one day when I heard my uncle across the

Supply a better ground (try using a wire braid for example between the trunk lid & vehicle ground) or try another location on your vehicle.

You've chosen a good example to demonstrate what is wrong with your analysis.
The reality is that there is no difference whether you are transmitting
pulses or steady state. The oversimplified "lumped element" model breaks
down when you are not transmitting steady state. That is because it is
an analytical approximation that is only accurate enough to study steady
state analysis.
A "distributed element" analysis (which is accurate under all conditions)
considers the power flow through elements. And it demonstrates that power
(pulsed or steady state) does indeed flow back into the transmitter as
I have said.
Do you really think that power somehow travels differently depending upon
whether or not it is pulsed? If I shine a flashlight at a mirror, does
pulsing (blinking) the light make more light power get to the mirror? Does
leaving the lamp turned on make less light emit from the bulb (by operating
"less efficiently")? Of course not.

> We will have to "agree to disagree" about power getting back into the
> transmitter. Without access to my references, I doubt if I can convince
> you otherwise.

I'd like to see a reference that contradicts this. I'll rip it apart
(figuratively).

Selling to help settle a family estate

There is one tube driven CB, It's made by Johnson, it says "Messenger" on
the front and there is a casting of a Viking, so I presume it's a Viking

Messenger. The model # is 242-128. Chrome front. From what I found out
this is what they called a "White Face"

There is one tube missing, as well as 8 of the 10 crystals. However, if you
can dig up a schematic or tube diagram and let me know what the tubes and
crystals are, I probably have them here (tons of crystals and tubes from

this estate)

The other CB is a Midland. Model #77-155. Looks like your run of the mill
radio, transistor. No mike attached to it, but it's a four pin
connection.

I also have a very old Marconi/Raytheon Models 1583D and 1585B, two pieces
of a set. This is a mobile radio, tube driven at 6 volts. Freq. 162-172

Mhz. It has some parts missing, Like crystals, but nothing of the
circuitry. 30 watts output. Has a very old hand held mic attached to it.
Looks like something that Andy Griffith would use :-)

email me with your offers or questions

William

Greetings!

No, what I heard what he was praying to Allah, then decided to ask for "local info on the Atlantic", or a 10-36 on channel 19, which killed the autopilot. There was a Cobra 19+ on board, and was still pinging due to the RF-limited Echo Power Mike with RB stuck on, which confused the ROV.

Fortunately, it didn't have airbags. You just never know these days.

What happened to the engines was when the reply was "you gotta speak a little louder into the mike.", he turned on a SkyWave Amp and the darn turbines dogged down so much they flamed out due to the torque placed on them by Leece-Nevilles used to keep the battery voltage up.

Some "aftermarket" upgrades should never, ever be tried, without checking your warranty.

Put the Alternator mod on one engine, not both.

We'll see what the NATSB has to say, after the FBI and FCC look it all over...

While Dancing with the Mouse on 18 Nov 1999 00:56:06 GMT, the Modem interrupted with an MNI from "rhooligan2@aol.com (RHOOLIGAN2)", and the MotherBoard buffered this to Video RAM:

Greetings!

Whats the match on the roof of the car?

[Thats really the best spot to put it.]

Then if the match is lower on the roof, the trunk section needs to be looked into and figure out what is causing the mis-match there.

A lot of times, it's the wires for a rear-window de-foger/icer or the rear pillars used to support the roof.

Even a poor ground return - which can be verified by measuring resistance from the trunk lid to latch assembly for that lid.

A small difference from ohmic measurements from battery ground to trunk lid [a difference of .2 ohms or higher when compared from frame to battery ground] leaves you a lot of room for RF problems.

A Trunk lid is bolted to the frame, versus the seamless pillars that are welded/soldered onto the lower main frame and finish metal.

Forget the roof if you have a soft-top or tonneau cover...sigh...

While Dancing with the Mouse on Wed, 17 Nov 1999 14:16:53 -0700, the Modem interrupted with an MNI from "T.H.E.CAT@surfside.edu (T.H.E. CAT)", and the MotherBoard buffered this to Video RAM:

Will the structure hurt signal? Ideas will help.

No, but the lowered height will. The bottom of
the antenna (feedpoint) should be at least 37
feet above ground (1 wavelength at 27 mhz) for
optimum performance

Are you refering to Microsoft Netmeeting? This software may already be on your computer, it was included with Windows 95 & 98. It allows you to communicate with other computer owners via a public server using your computer sound card and microphone. It also supports a video link if you have a camera set up. Not exactly CB, but you can converse with about any country on Earth, language being the only barrier, try it, it can be fun!!

Dave

Greetings!

[Disclaimer, I don't readilly know your setup, type of vehicle, and other particulars that are described, but I need to know some other things that hopefully this message will help outline for you to take a look into and try...]

Well, lets' take a look at the issues one at a time below...

While Dancing with the Mouse on Wed, 17 Nov 1999 15:34:02 -0700, the Modem interrupted with an MNI from "Kevin Brady <kbrady@rsinc.com>", and the MotherBoard buffered this to Video RAM:

:+> Got an odd problem with my CB antenna. I was out 'wheeling with some
:+> friends, and on the way home we were listening to the truckers on
:+> channel 19. There were numerous times where my buddies could hear
:+> truckers that I couldn't hear well or at all. Their signal would break
:+> up. They could hear me broadcasting fine, but I often couldn't hear them
:+>
:+> very well.

Hmm...faulty mount? I think I'll need to take a look at that picture.

Lot's of times, and I just recently got some flammbe'd stuff regarding this...

The Coax? What are you up against?

Lot's of times, the pillar mount types like the one you seem to describe, work fine and always will show a good SWR, with one small problem.

The vehicle is not providing the best ground there. You are experiencing what I've got flames over before. Poor ground connections where the working element, the antenna, is not really working the vehicles ground. Instead, it's using the coax.

Coax, shielded inside a car, or any vehicle, makes a poor antenna. When your antenna mount decides not to ground at the antennas location, the coax acts like the antennas other element, or what the vehicle should have been, but isn't. Receive cuts in and out.

Although this may be another topic, where and how is the radio mounted?

There's a lot of variables...

One, proximity of your receiver to the other truckers, or other traffic on another channel could knock out your receive while others travelling along with you, can hear other on the channel just fine. It's not a fault of the antenna, it a characteristic of the radio, trying to hear only the channel you're on, not the other channel. The radios attempting to reject the other channels signal, while trying to sort out yours.

When using a "mickey-mouse" [sorry, it's the best way I can put it] type of mount, where holes are not drilled and it requires compression, like a trunk lid or rain gutter thru the use of set-screws, they don't work 100% of the time due to paint being an insulator and rust ruining the connection.

Having your radio mounted to metal helps take care of that. A poor connection can occur at the antenna. The radio will use the ground of the vehicle if you mount the metal case to the vehicles own ground - the coax then has the same shielding potential at the mount and at the radios, even if the connection to ground at the antenna is poor.

The bracket offers the most convenient means. Plastic is a poor conductor. So, metal to metal is the best.

:+> We decided it was my antenna, so I did some experimenting at home. I
:+> turned on a NOAA weather channel to get a constant signal, and after
:+> some testing found that if I touched the antenna mount just below the
:+> antenna, I got good clean reception. When I wasn't touching the antenna
:+> mount the signal was scratchy and not very good.
:+>
:+> The question here is this: When I touch the mount am I grounding the
:+> antenna, making it better, or am I a better antenna than my antenna?

You're better than the antenna, at picking up WX frequencies. The antenna, if it doesn't say it's tuned for WX-band reception [it'll say it on the package] you take chances. WX-band is in the VHF section, you're in the HF section of the band. Most WX-band compatible top-loaded antennas will have a separate close wind about 12" above where the mast meets the ferrule for the mount. You can see it in the shrink-wrap of the protective outer sleeve.

Antennas for CB that are 3 feet or shorter, can't tune to WX-band very well. You'll need a longer antenna for that purpose. You can get by with what you have, but it's also the reason why you're out here too...

:+> I've got a Midland 77-115 "WeatherMax III" CB with a Firestik II 3'
:+> antenna mounted to the driver's side windshield frame. The antenna was
:+> tuned at the shop I bought it at and they said I was getting an SWR of
:+> 1.4. I can send a pic of the antenna mount if anyone's interested.

I have a Midland 77-115, and I can attest to the fact that it *does* require the use of antennas that have WX-capability. Otherwise you don't have the best reception in fringe areas.

:+>

3045. Re: A99 SWR question

Newsgroup: rec.radio.cb
Date: 1999-11-18 00:00:00 UTC
From: CodysPC@Iserve.Net
Message-ID: <3834474e.156131643@news.iserv.net>
Source record: 11430

Greetings!

Sounds like bad coax connections, or you have an SWR meter with Field Strength, or F/S. Don't touch the F/S metal knob where the sensing antenna goes to. This can give you your "funky SWR" problem.

If putting your hand on the meter, makes the SWR go up or down, you have a poor coax connection somewhere.

If you can, pound a stake into the ground where you place the bucket. This way, a ground strap can be fashioned and connected to the A99 at the location, helping to keep the coax from becoming part of the antenna. The rod stays in the ground, and pound it flush to earth so you can mow over it, and neighbors don't see it.

While Dancing with the Mouse on Wed, 17 Nov 1999 15:43:14 -0800, the Modem interrupted with an MNI from "Adam <adam26@nol.net>", and the MotherBoard buffered this to Video RAM:

3046. Re: Question: What To Use To Catch A CB Jammer Transmitter/Base

Newsgroup: rec.radio.cb
Date: 1999-11-18 00:00:00 UTC
From: CodysPC@Iserve.Net
Message-ID: <383448a1.156471423@news.iserv.net>
Source record: 11431

Greetings!

Try using a mag mount antenna base, with a simple "stubby" antenna, like a scanner antenna, it'll still pick up signals, only a lot weaker in your favor.

Place the mag-mount on the rear-portion of the tailgate, trunk lid or hatch.

Connect the coax to the radio, set your RF gain all the way up. Look at the meter, and turn down the RF gain to 1/2 scale if he's full scale, or at least 1/2 scale on the RF/S-meter of the radio.

In a parking lot, drive in a circle and watch the meter. It'll rise only in the direction the vehicles nose is pointed to. Thats the direction to take.

Then go in that direction. Until the meter is full scale, then reduce again, find a parking lot and repeat above.

This can get you to within 100 yards by simply using a de-tuned antenna and the location of the antenna on the vehicle by repeating the steps above. This gets harder as the signal rises, you can then simply remove the antenna from the mount and use the metal mount, or ferrule, as an even less sensitive antenna. This can get you pretty much to within 3 houses, or within sight of the antenna, of the offender.

A cheap way of doing it.

RDF'ing an offender is not easy all the time.

While Dancing with the Mouse on Wed, 17 Nov 1999 23:50:18 GMT, the Modem interrupted with an MNI from "DogCatcher@ThePound.Net (Charley)", and the MotherBoard buffered this to Video RAM:

:+> Could anyone tell me what to use as a radio direction finder
:+> or where to look on the web for more information for catching
:+> a CB jammer base station? All I've found in the way of
:+> RDFs are for 130 MHZ and higher. Need something for 27
:+> to 28 MHZ.

3047. Re: MC 10kw Jesus

Newsgroup: rec.radio.cb
Date: 1999-11-18 00:00:00 UTC
From: CodysPC@Iserve.Net
Message-ID: <38344b58.157165923@news.iserv.net>
Source record: 11432

Greetings!

Oh geez, lets not get Mr. Ohm rolling over in his grave again...

10KW Jesus is correct, in the fact that if you're happy with what you have, then don't let anyone else interfere.

You're making things too complex.

Break this down Bob.

If the antenna is resonate, or provides a 50 ohm impedance using coax of 18'. We'll see an SWR of 1:1. Because the antenna is tuned to make resonance at 18' of coax.

You'll find out that it's not the vehicle that makes a good antenna. The counterpoise it provides at different locations, is far from ideal to allow the antenna to be resonate without the *manufactuers required* length of coax to provide for it. Something else is occuring and I beleive we agree on this.

If the ground/counterpoise can offer this same level of resoance the antenna is working against, the coax should be able to decouple itself and remain a feedline to the feedpoint.

If it's not ideal, we no longer have a feedline, we have an antenna with all this coax, and the feedpoint is actually the part [PL259] connecting to the radio.

Don't blame the antenna, the coax, the SWR meter, or the Radio. It's the operators fault that they can't set up the antenna where *it* wants to be. Or should that read, where *you* want it to be[?].

Blame the CB'er, then get on with your life.

We're already accepting the faults regarding antenna placement.

We can live with it.

Millions of us have, are now, and always will.

While Dancing with the Mouse on Thu, 18 Nov 1999 02:05:27 GMT, the Modem interrupted with an MNI from "MC 10kW Jesus <qsl27@hotmail.com>", and the MotherBoard buffered this to Video RAM:

Message-ID: <T.H.E.CAT-ya02408000R1811991213280001@news.earthlink.net>
Source record: 11434

To all of you who responded to my inquiries about the Wilson 1000, thanks bunches for the responses and suggestions. I will try them out and share my conclusions/solutions with the group.

Even at 1.5.1 it still kicks a**. The other thing I noticed immediately about this antenna is how much better it "hears". The difference is astounding. And my three ft. Firefly was flat all the way across!

I'm sure everyone in this group has their own "favorite" brand of antenna they swear by, but anyone looking for a mobile mag mount antenna, the Wilson is a great product. I will miss my 3 ft. Firestik, but it's just seen better days (lotsa use, lotsa road miles).

Thanks again,

--

3052. Re: Product Review : Radio Shack HTX-10 10M allmode rig

Newsgroup: rec.radio.cb
Date: 1999-11-18 00:00:00 UTC
From: Harry <N5JOY@hotmail.com>
Message-ID: <383454C8.7D72F2CD@hotmail.com>
Source record: 11437

Well, well, well....

Just received my HTX-10 Service Manual. It's finally off backorder.

Unfortunately the index indicates that the schematic is on page 54 - there is no schematic, and page 53 is the last printed page before the rear cover. Another copy of the instruction manual was attached. All this for $20 some bucks... ya-hee. Rushed out the door, perhaps, given its backorder status, dunno...

[Dunno if this was just a mistake on my manual only, or if this was a printing problem, or if the packager just forgot to grab the schematic and put it along with the service manual - conceivably it could have been a separate 2-page foldout item, not bound into the book. Got in touch w/Tandy and "they're looking into it". My local RS store manager said if that didn't do it, he'd help rattle some cages; he understands why schematics are important to hams and that many of us are not "consumer product" people.]

Nevertheless, it does lay out PLL calibration, give comprehensive alignment steps & test trees, etc.

Prob. much of this manual has been somewhat "boilerplated" from the TRC-485 CB manual - for example, a voltage chart for most all the transistor E/B/C or D/G/S measurement points includes introductory standard conditions, including the text "Measurement channel: CH 19". I'm hoping these test values are correct, as the TRC485 seems to use an older & somewhat different board than the HTX10. English text is OK but with a bit of an abrupt style.

A Very Preliminary Quick Look

(warning: prob. an error or two here... just what I can quickly infer from a convoluted blk diagram)

Looking at the blowup pics of the CPU board I see no sign of jumpers, 0-ohm "resistors", or friendly areas where diode matrices offer "configurability".

The PLL synth + CPU + display controller LC72322 runs off of a 4.5MHz xtal clock. This clock xtal is "pulled" by the clarifier control in conjunction w/a varactor. (This is OK

since CPU doesn't perform any ultra precise timekeeping duties
and is primarily only for PLL frequency control & assoc. dial
& display functions.)

This 4.5MHz oscillator does not appear to feed anywhere else
other than the PLL/CPU chip. The dividers (or early "swallow
counter" stages thereof) on this PLL are fast so no offset
mixer is needed. (The 72322 apparently will run a PLL at up
to 150MHz.)

The FM modulator is not apparent from the block diagram; I'd
bet they just apply some filtered & preemphasized mic audio,
when in FM mode, to the varactor on this 4.5MHz reference.

NOTE: the 10.24MHz is 2nd AM/FM LO is *ONLY* (at least from the
blk diagram). Even though 10.24MHz is a "friendly" number for
PLL CBs it's not really useful for the HTX-10's 1KHz PLL steps.

The 10.6975MHz "carrier osc" xtal is "pull-tuned" by LC circuits
for the 3 modes - 10.6975 is for USB mode, 10.695MHz for AM,
10.6925 for LSB.

But according to the diagram, it doesn't seem to need this osc.
for AM/FM receive as SSB and AM/FM have 2 separate receive
signal paths. In AM or FM, the VCO mixes sig down to a 10.695MHz
1st AM/FM IF, w/no gain stage. Then, a 10.24MHz 2nd L0 mixes 1st
IF down to 455kHz 2nd AM/FM IF, where there are 2 gain stages
before AM or FM detectors.

For SSB receive, it appears that after 1st conversion mix w/VCO,
a 10.695MHz resultant SSB IF signal runs thru xtal filter & *four*
gain stages) before a 10.695MHz (+/- 2.5kHz offset for USB/LSB) is
injected into product detector to bring it down to audio. (Is
this mixing operation "demodulation" or also a "conversion": that
is, can we still call this double conversion? Hmmmm.)

From the above numbers, you can kinda infer the transmit path. A
10.695MHz (AM; +/- 2.5kHz for LSB/USB) carrier oscillator is run,
in SSB modes, thru a balanced mixer; no mod is run thru the bal.
mix in AM mode. This bal. mixer output sig is mixed w/ a VCO signal
up to 28.xxx MHz. In AM mode, a 3 stage transistor modulator feeds
the driver & final amp. (No, they didn't turn around the audio amp
IC in transmit like lots of older CBs.)

But given the above, with the standardized filters/tuned ckts set
up for those IF freqs, and with no "mixer offset oscillator", it
looks like one really can't change xtals to move freqs; the PLL
divider number must be changed.... and that's only software
accessible. Adding mixer/buffer/offset ckts in both T and R
would be the only way to "pull" this radio - or to replace the
PLL control unit...

More when I know more (and/or correct mistakes above...)

Yeah I have netmeeting and use it. When I heard my uncle across the road talking to his friend on the cb. I also could talk to them. I had to turn the speakers up loud to hear them but it worked. I also pick up a faint sound of a am radio staion here. I have to crank the speakers to barely hear it but i can. IT was kind of weird when i talked to my uncle on here. I just talked through my mic. I asked if he could hear me and he said yes. Then shortly after I lost the connection.... He is like right across the street from me. He uses a amature ham radio cb. Dont know if thats how to explain it. It's a cb with ham stations. He has a 150 watt amp on it. When he uses it his car cb keys up. Even when it is not on. We live sorta in the mountains so were up pretty high. Would that have anything to do with it?

Mag mount antennas can be tricky. Is the case of the radio grounded? If it is mounted in plastic, you have an unusual ground problem.

Keep your second hand away from the SWR Meter as you read it, and watch for a signal strength antenna socket. Sometimes your had near such a socket will induce an artifact.

The DDF-1 in the Ramsey catalog IS a doppler and works great but only
works down to about 100MHZ.I built thier unit and was especially
impresed with the digital filter.If you try one of these Ramsey has a
mistake on the switcher board causing the array to spin backward.The
easiest way to fix this is to reverse pins 2 and 4 at the DB9
connecter.I told Ramsey about this but they didn't seem too exited.

> pulsing (blinking) the light make more light power get to the mirror? Does
> leaving the lamp turned on make less light emit from the bulb (by operating
> "less efficiently")? Of course not.

Let me expound on this. And let me define a few terms first.
Lumped elements are common circuit components (like resistors,
capacitors, and inductors) that are much smaller than a wavelength
and can be analyzed in a circuit with little regard to how
electromagnetic waves propagate along them.

Distrubuted elements are circuit components where length and time
is a definite factor in circuit analysis (best example is a
transmission line).

Lumped element analysis is the simplest and easiest. There is
little need to worry about where and how the power is flowing.
For steady state analyis, even distributed elements can generally

be treated as lumped elements. This reduces the complexity of
the analysis.

The highly revered Smith Chart is a "lumped element" analysis. That
is, it describes a circuit merely in terms of impedances that could
be created with equivalent lumped elements like resistors and capacitors
(or inductors). It does not attempt to describe power flow. For most
applications (which are steady stae) it does not have to. For steady
state analysis, it is an accurate model.

But, when you leave the steady state (when you start transmitting pulses),
the model breaks down. What you get are not the impedances seen on the
Smith chart. A little more complex analysis is required. It becomes
a control theory analysis requiring a look at the power flow and the
characterisitic impedances.

Does power flow differently when it is pulsed than when it is in steady
state? Absolutely not! The lumped element analysis is a simplified
analysis that is 100% accurate in many cases but not all. You have to
understand its limitation. The distributed element analysis is
accurate in all cases (steady state, pulsed, whatever you got).

Now back to the original question:
Does a transmitter transmitting into a mismatch merely "operate less
efficiently" or does the power actally flow out, then back in to be
ultimately dissipated by it?

If you perform a lumped element analysis, you can find an equivalent
impedance for the input to your coax, substitute it into your circuit
for analysis and find that it appears that the circuit is merely
operating inefficiently and no power goes out or comes in.
(This is what you are doing).

But we know that isn't true because it can be shown with a power meter
that there is a lot of power out there going up and down the coax.

Furthermore, if you leave the steady state and start transmittion pulses,
your analysis goes all to hell and your predicted results do not agree
with your imperical results.

But, if you use a distributed analysis, you find that power does
indeed go up the transmission line and back to be absorved by the
transmitter. And, steady state or not, this analysis agrees with
the results.

Bottom line: For a 50 ohm transmitter, reflected power does flow into
the transmitter where it is dissipated as heat.

Technically, that is not true. While there are 3 "elements" they are not aranged in a typical yagi fashion, and do not provide the same advantages. The driven "element" changes, with the antenna switch, and the remaining 2 become parasitic reflectors, making it roughly equivilent in performance to a 2 element beam, which explains the pitiful gain numbers.

Yes, it does.

> If this was the case then you should be able to connect
> two radios together and key each of them together and they would both
> see a 1:1 match. They won't see this at all,

Well, actually, they do. You just can't measure it.
All power from transmitter #1 goes into transmitter #2; and all power
from transmitter #2 goes into transmitter #1.
No power is reflected. The power coming back is the transmitter
power from the other radio.

> and i know that you
> would never do such a foolish thing, because you know they wouldn't

> ahead and take the meter readings of such a hook up.

The transmitted signals *do* see 50 ohms. The problem is you
have power coming back from the other transmitter. It is impossible
to separate the measurement of the reflected power from the measurement
of the other transmitter's forward power.

> Be quick with
> your measurements before you overheat anything. Report the results

You know it. That was a good hypothetical situation. I'll leave
the experiment up to you.

3078. Coppers Tips & Tricks Video #9

Newsgroup: rec.radio.cb
Date: 1999-11-18 00:00:00 UTC
From: Bendthelite@webtv.net
Message-ID: <11765-38346EE3-51@storefull-115.iap.bryant.webtv.net>
Source record: 11463

I very recently purchased an Eagle Sidewinder 400 10 Meter radio from Coppers Electronics. The radio was in perfect asthetic and working condition, but of course needed to be converted for channels. The modification for this unit is all over the internet and i had no problem finding it, but, what i was not aware of until i received the radio and opened it up to convert it, was that Eagle has changed the circuits in the radio to make it harder to modify for frequency expansion. So, i ordered the Tip & Tricks video # 9 tape that has different types of modifications for the Sidewinder, all the while wondering if the tape, shot 2 years ago, had been updated to reflect these circuit changes made to the radio, but assuming that no tech, except a crooked one, would continue to market a modification video for a specific radio that was no longer accurate because it was outdated.

Well...the Tips & tricks video tape #9 from Coppers Electronics is outdated. And, if you purchase it to get the 400 channel frequency conversion information you will have wasted your money, and will have been ripped off. All the other information on this tape is still valid, but the 11 meter channel conversion information as presented, is impossible to effect because the circuits that the video instructs you to alter are no longer there. So, do not buy the video for channel expansion until they update it and make it current, or you will be THROWING YOUR MONEY AWAY! They have even put a picture of the new radio on the video box, (has no Ch9 print on the upper level center button on the front panel), old ones did, to make you assume that it features the channel mods for that radio. IT DOES NOT!!! Only for the old one...period. That they put in an effort to change the photo on the video box from the old radio to the new one, proving that they realise that the radio has been changed, but did not update the channel expansion information accordingly, seems to point to a willful intent to defraud. You decide, but it seems that way to me.

This is not a complaint about Coppers service or products in general, i have had really good service from them. But, only that this tape has not been kept current to reflect changes made the unit concerned.

I figured out the new channel modification procedure, and made this change to my radio last night, and i could not be more pleased with the results. I now have 400 channels, 5 kc's up or down for each one, USB, LSB and FM. For the money, this is the best 10 meter unit i have seen.

As we all know, money is hard to come by, and i would feel really bad if i thought more people were getting ripped off on this video like i was, only because i did not speak up.

I think you meant DSB, but that's a whole different animal. There are some HF stations that use DSB - which sends both sidebands but no carrier. That is something that is REALLY strange to listen, because it sounds pretty much the same regardless of whether you listen to it with your receiver in USB, LSB, or AM mode. There are a couple of HF "numbers" stations that use DSB frequently. One of them is known to come up on 8992.0 occasionally, which is how I first discovered it (the station, not the mode).

For the most part, I agree. The only exception I can think of for SSB is the phenomenon known as polar flutter, something I've observed on HF from time to time - in fact just last night I was getting polar flutter on a signal from Thule AB in Greenland on 8992.0 while Thule was running a phone patch to Lajes AB in the Azores for one of the USAF aircraft involved in studying the effects of the Leonids meteor showers. The aircraft (AGAR 35, probably a modified EC-135 belonging to the 452 TW at Edwards AFB) was over Madrid at the time...none of the participants had any trouble hearing and understanding each other, but I did notice some polar flutter on Thule's signal, as did another SWL in Texas with whom I was talking over IRC at the time.

Thule's signal was plenty strong enough, so the polar flutter did not affect intelligibility, but I suspect that at weak signal levels they would have been rendered unreadable here. However, I don't think that's going to happen very often with an EME signal.

If I may expand on the impedance ratios a little as this is an area of great confusion.....:->

A balun is a transformer. That's probably why they are called "balun transformers". Just like any transformer there is a voltage ratio. This is equal to the turns ratio of the transformer. So, if you had 1 turn going in (primary) and 1 turn coming out (secondary), the voltage ratio would be 1:1 If you added another turn to the secondary the voltage ratio would be 1:2. However, the impedance ratio is the square of the windings so it would be = 1^2 : 2^2, or 1:4, usually referred to as "Four to One". This is ultra-important if you are experimenting with these devils. You'd be amazed at how much power you can safely pump through a very small toroidal balun.

Joshua, the short answer is no. The long answer is that it is technically possible. There are devices made called duplexers that allow you to transmit and receive on one antenna simultaneously. However, because CB channel frequencies are all very close together, the size and cost of this duplexer would far exceed the value of even the very best CB radio. In fact, the size of this duplexer would be about the same as a big refridgerator.

He won't post because he can't. What he claims is pure hogwash. I followed the situation very closely and wrote several articles regarding this. As of present, Kingston, NY stands alone in their perserverance of flagrant radio violators. Kingston passed an ORDINANCE(not federal law)locally that allows them to persue what they deem "problematic". This may be what he is referring to. Lots of talk though, coming from the Hill(Capitol) about enacting some sort of nationwide allowances to local authorities.

That would be theft, and not a crime against the state.

Crimes against the state are (usually) to get a certain freedom, and usually
do gain constitutional amendments....

Crimes against the person don't.

Big difference.

2 combiners in the 4 pill and up, input and output, just a different # of
ports. Which each combiner would have the same attenuation regardless of
the # of ports.

> They are a <<bit>> lossy, but do work.

How would you tie multiple stages togther any more efficently without them?

Well Dwight, go back and read my first post on this topic. Yes, I have over a hundred countries. Yes, I did the majority of contacts on the freeband. All contacts were made between 25 and 27.995. Most times it was 12 watts out on the sideband. This is not a miracle or even really all that hard when the conditions are on. I seem a bit perplexed as to how, and why, a licensed ham can not perceive this or come to a realization that many folks have over a hundred countries in their logs running nothing but legal power. It just isn't that big of deal. Sure, it takes patience and lots of radio time, but....you are still wrong.

>Spiker

What you mst likey experienced was his illegal amplifier bleeding over
onto your computer's speakers. The radio simply overloaded your
amplieier in your speakers. It is common for illegally amplified CB
radios to interfere with consumer electronics. In rare cases, also,
perfectly legal radio setups can do this, due to poor filtering in many
audio/video products out today. CB amplifiers, being illegal, obviously
have no technical standsrds for quality control. As such, many of them
are rather dirty. Also, many CB operators modify their radios, which
cause this "bleedover effect" due to cranking their radios beyond design
limits. Couple this dirty radio with an amplifier and you really have
problems.

Funny, I didnt see any mention of Amateur Radio. You remember Amateur Radio, don't you, John? Lots of CW still there. Give a listen sometime *in* the ARS CW bands, you just might hear some. Unless of course you prefer to listen to encrypted RTTY signals. Oh, and last time I checked, my knuckles weren't dragging on the ground. You must have mistaken this CW op with someone else when you made that general statement. Oh, and good DXing./SWLing.

3115. Re: Turning up a radio

Newsgroup: rec.radio.cb
Date: 1999-11-18 00:00:00 UTC
From: Toll Free <tollfree@bigradios.com>
Message-ID: <e_1Z3.16753$Ph7.124582@insync>
Source record: 11550

Simple.

Their is a small diode near the modulation transformer (the big thing on the rear of the radio, towards the right hand side). It is usually made of glass, and has a lead sticking out of each end.

Should have a device number like Dxx

You can clip one end of this.

Then, near the "finals" of the radio (in quotes because their is only one final in this chassis) you have a black slug in a clear or brown covering that you can turn in and out.

Remove that slug.

Done.

See about 20 to 25 watts.

> the # of ports.

Not necessarily.

Build a multiport combiner (4 port for an 8 pill) and you have a combiner
that is less lossy than one that combines the two amp boards, then one that
combines those.

>
>
>
> > They are a <<bit>> lossy, but do work.
> --
--
> ---------------------
> How would you tie multiple stages togther any more efficently without
them?

I would use larger cores than Texas Star, I would use different permeability
than they use to get more inductance.

I like how tight they wrap them, though. Makes for less RF being "thrown
about" due to tighter coupling.

I am thinking about purchasing a Texas Ranger 696 F. I am comparing the radio overall to a Grant XL. Whats the over all quality of the 696F compared to the Grant XL? How bout the receive? Is the NB very effective? Drift on SSB?

The main question is- are they like the older uniden/cobra's or like the new jokers cobra is putting out?

I like a freq. counter built into my radio, but if it has the problems of the 148F I'll buy something else.

Source record: 11571

I have a Newmar Travel Trailer (made with aluminum siding) and I put up a "No Ground" antenna made by I believe Wilson. The coax that comes with these kinds of sticks are measured to provide the best SWR possible under the circumstances. Inside I am using a low end Midland that is probably ten years old and has had the internal speaker removed by someone a while back so I use an external speaker. This rig enjoys a SWR of 1.5:1 across most of the channels with the higher ones moving to probably 2.5:1 area. This is not a problem because all I need it for is to communicate with the tow vehicle when the two are not at the same place at the same time.

Perry

The microphone wiring for the HR2510 goes like this:
This is the PinOut for the OEM HR-2510 Microphone that has President printed on it.
1. Audio
2. Shield
3. Transmit
4. Channel Up
5. Channel Down

For the Astatic Mic:
1. White
2. Shield and Blue
3. Red
4. n/c
5. n/c
Yellow-Not Connected.
Black-Not Connected.
These were used before to change the channels up and down that you cannot do with the Astatic. No harm, No Foul! Who needs to change the channels with the mic anyway.

Hope this helps.

Perry

Well lets see smart ass. Does your TV have expansion slots? Can you load
IBM or MAC compatible software on your TV?

So chew on this DICK Tracey. It would only take a relatively simple
board/circuitry to be placed in an expansion slot and software to drive it.
Gee, sounds like a AM/FM Stereo Tuner Card, doesn't it?

Jackass!

Hey Shark:

I just put up my I-MAX 2000 right at the end of my house. I have a single story ranch with brick veneer. The Roof Gable is about 18" from the attic vent where I put a short bracket. the antenna is atop 20' of steel mast. I used a RS ground spike to secure the end of the pole but otherwise I did not use any guy wires or such. It is pretty solid. I will say that this fiber Glass vertical can generate allot of static with the wind blowing by it, so I sincerely recommend that you provide the project with a good earth ground to bleed that stuff off. And, use some of those standoffs every 3-4 feet of coax to keep it away from the pole and to prevent the feedline from moving around allot. With my base radio all hooked up, I am getting 1:1 SWR readings and getting out really well. Have fun and hope this helped.

If you wanted to do a real full duplex from one radio that would
be most expensive and pretty difficult as I don't know of any radios
capable of this.
You could certainly do a full duplex if you used two radios and
two antennas. You would need to mount the antennas as far as
possible away from each other.
If you just wanted to talk on one ch. and listen on another in
half duplex fashion, that would be easy enough to do on one antenna.

This is a bullshit mod and it drives me bananas every time I see it posted. The values of the resistors are chosen as part of the band-shaping modulation circuit. changing them to lower values will give you a little more gain on the mic preamp but the reality is this radio, and the GrantXL, have enough gain already. If you remove the transistor the radio has no way of regulating the output on SSB. It will simply run open-loop. Anyone with a smattering of ignorance in amplifier design knows that turfing the NFB will add distortion.

> MODULATION: Remove R131
> AM POWER: VR10
> SSB POWER: VR11

If you remove TR24 above, removing R131 will have no effect on the radio.

On 2 meters, their is actually a positively endless roger beep. That is not controllable by the user, just the ower. But, human beings are gonna be human beings, and I've heard just as many confrontations on ham as I've heard on CB. Sometimes on CB, it seems to be the norm with a group of people. That is, these people get on there an bitch to each other but the funny thing is, they all seem to know what is going on and they seem to enjoy it. On ham, when you hear people bitching, you know thier is a definate confrontation going on.

Just purchased a couple of mobile 40 channel units. I've got them set up in my house now. Now my cash flow is getting maxed out, here is the question---> A freind told me that when he was a teenager he had a base set and made the antenae out of cable that he ran under the eaves of his roof. He said it had great reception! Is this possible? Could i get by for now with just cable? Are there any other low costs methods i could use to get airborne? Or do i have to wait till i can get a tower and all that jazz.

Thanks!

Ahh, but get this, if you have two radios with locked Tx/Rx tuners, then if one of the radios is just slight off, guess what, they will never be able to be tuned to each other!

Thats why radios built with seperate Tx/Rx, that is a locked Tx and a clarifier for the Rx. The reason for this is that not only are different manudactures going to be off, but temperature fluctuations cause frequency drift, and this is somewhat impossible to overcome.

In mym area, you can't just turn on the CB, listen for a few minutes
and say, "well that sounds like nonsense, I never wanna listen again."
If you consistantly check the band, you'll sooner or later make a good
qso and it will be enjoyable.

To may people buy a cb, turn it on and think that what they
immediately hear is exactly how CB is, and this isn't true.

The term "balun" is a derivitive of the words "BALanced to UNbalanced".
It is used to matched an unbalanced feedline such as coax to a balanced
antenna such as a dipole.

3170. FS: [Update] A couple of Boatanchors and old Midland CB - make me an offer but please be reasonable

Selling to help settle a family estate

There is one tube driven CB, It's made by Johnson, it says "Messenger" on
the front and there is a casting of a Viking, so I presume it's a Viking

Messenger. The model # is 242-128. Chrome front. From what I found out
this is what they called a "White Face"

There is one tube missing, as well as 8 of the 10 crystals. However, if you
can dig up a schematic or tube diagram and let me know what the tubes and
crystals are, I probably have them here (tons of crystals and tubes from

this estate) This unit has been sold

The other CB is a Midland. Model #77-155. Looks like your run of the mill
radio, transistor. No mike attached to it, but it's a four pin
connection.

I also have a very old Marconi/Raytheon Models 1583D and 1585B, two pieces
of a set. This is a mobile radio, tube driven at 6 volts. Freq. 162-172

Mhz. It has some parts missing, Like crystals, but nothing of the
circuitry. 30 watts output. Has a very old hand held mic attached to it.
Looks like something that Andy Griffith would use :-)

email me with your offers or questions

William

Something doesn't sound right here. If you have 1.5:1 on channel 1,
you are saying that you also have 1.5:1 on channel 20 and channel 40?
I don't think this can be. You should see a slightly higher or lower
SWR between channel 1 and 40. Depending on this difference, you can
make the choice of pulling the antenna up a little or cutting the whip
by a few millimeters.

Get some coax and peel back 18 feet of shielding from around the
center conductor. Then, stick it up in a tree next to your room.
Drape the other end with the PL259 into your window and connect it to
your CB. Viola, you now have a halfwave dipole.

mount a firestick antenna above the roof. I have had good luck doing this. I used a magnet mount stuck to some metal on the back of the roof. I had no problems doing that.

I think you mean peel back 9 feet (ie) 9 feet of center conductor as half of
the antenna and the shielding makes up the other 9 feet for a total of 18 feet
with the feed at the middle.

Or you could take a 2 foot 2x4 and nail it to the eav right at the peak of the roof.
Then take a 9 foot copper pipe drill two holes about 4 inches apart on the lower end.
Use screws to mount the pipe to the 2x4 and hook the center conductor to the
base of the pipe.
and use 4 wires cut 9 feet long for the radials at set at every 90 degrees hooked to the
shielding.

you don't want to put 1kw in to it because it probably would set the 2x4 ablaze
but it is perfectly fine at 4 watts

And you can use a 4 or 5 foot 2x4 if you want to elevate the feed point a bit

You guys make me laugh you tell me I wont get out with my 32 pill but you guys work the whole world with 25 watts? I have a hard time hearing the next town over when they run 25 watts on 11 meters. although there are some rare conditions.
IM not just saying I cant reach them I am saying I never heard them. I heard Canada a couple times..

I am talking about with an antron.

3198. COMPLETE Siltronix/Swan station....

Newsgroup: rec.radio.cb
Date: 1999-11-19 00:00:00 UTC
From: "MIKE (707)" <no4n4x4@hotmail.com>
Message-ID: <9D5Z3.27509$YI2.1248156@typ11.nn.bcandid.com>
Source record: 11542

Is anyone interested in buying a COMPLETE Siltronix / Swan station? I have a Siltronix 1011-D (26.935-27.865 10 meters removed) and a Swan 1200-X amplifier, a FD-1011 freq. counter, Siltronix SP-1011 external speaker, Swan CM-17L (Shure 444) microphone, Swan WM-3000 (0-2000) watt meter, and ONE extra 8950 power tube. MOST gear is 7/10 . The radio needs the new tube. I have owned the radio for 20 years, and am the original owner. This set-up will DX damn-near anywhere! If you can hear 'em, you can 'work em.' If NO ONE is interested, I will eBay it. I am asking $500.00 firm. Surf the web... check-out the prices. This is a VERY good deal. A COMPLETE station. Oh ya, the amp does 350-400 watts P.E.P. on sideband. SERIOUS INQUIRES ONLY !!!! No SPAM, NO FLAMING, and NO B.S.

MIKE (707)

Here's the dicrepencies:
1. Siltronix 1011-D needs new POWER tube. I'll give you ONE.
2.Swan amp: ONE scratch on face(barely noticable)
3. Microphone: slight dent on top
4. Freq. counter: ONE segment of ONE digit burned-out.
All other stuff is in"A-1" condition.

Hi, all;
There are some great sellers on eBay- and then there are some who are not. One in particular is a user that has the name "LADoctor" and also used "Doctorld" Please beware of this seller. Do your best to look for someone else that has a similar item you are looking for. I received one item that looked like had been in someone's barn for 40 years. And the other, which I haven't received after almost two months, also looks like crap. It was sent to the WRONG PERSON and he sent me pics of it. It is a piece of junk! BEWARE.....

Sent via Deja.com http://www.deja.com/
Before you buy.

>reciever with FM.

I guess I'm a little dense, but how do I use FM to find someone on AM?

I checked out the Ramsey DF-1 and spoke to tech support. They
don't have any specs on their website for the frequencies it will
work with, but the tech guy said I could use it with a CB.

I'm waiting for a reply from Copper about their "Signal Hunter".

Thanks, everyone, for your helpful input.

Charley

Any have info on the Silver Eagle 200 amp?
I have one and and wonder who made it and it could be retuned to the Ham 10m band?
Im a ham myself working on Gen class upgrade..

Also those on the W. Mi. area, Im with the USCBOA and have signed up to be local Rep.
If youd like more info you can email me or contact me via AIM

I just talked to someone at Wilson. They are not out of business.
Yes, they were sold but they are keeping the name. They are moving
their operations to Illinois. They will still be made in the U.S.A.
and they plan on staying the leaders in CB antennas.

Yo Scott,

I just did explain it. The Voltage ratio of the transformer is equal to the turns ratio.

The Impedance Ratio is equal to the SQUARE of the voltage ratio. Read it again, and if you still don't understand I'll try explaining it a different way.

Dick's original question, Arnie, was the following:

> Lets see, now.... Where is the commercial radio demand for
>RTTY, PACTOR, PACKET, or CLOVER? Or SSB?

My comments did not address the considerable use of CW on the amateur
bands because that was not what was asked.

The reference to knuckle-dragging was meant to zing those like Dick
who seem to have no use for any mode other than CW, and not meant to
zing people who enjoy the use of that mode IN ADDITION to regular use
of other modes, whether mentioned in the discussion in question, or
not. If the shoe fits, feel free to model it for us, otherwise, keep
those knuckles up where they belong and have a nice day. :-)

>cause frequency drift, and this is somewhat impossible to overcome.

Who cares if they drift? If RX and TX are tied together then they'll
drift together.

people on this group dont understand what we talk about because there am only ducks. 25 watts wont get you no where on am and on the regular 40 but find a clear freeband freq and thats all you need. i still say that 32 pill isnt gonna make you king of the east coast but you should be able to talk good between keys. go listen to 27555 usb any morning and youll hear european stations all morning long. evidently your one os those guys that never leave the regular 40 am.

ps its harder for you to hear canada because your closer. there in my radio almost daily full scale on the meter

That is because many hams are still stuck in the past or have a much
bigger case of nostalgia, than they realize. I think the point that John
was trying to make is that if CW is obsolete from a commercial
standpoint, then the only reason that hams still cling to it like
rusticles on the Titanic, is for purely aesthetic reasons. There isn't
much that CW gives you that a more modern mode cannot (And usually with
a much faster BPS rate).

I had a friend that also bought that radio from Copper, and also got bit with the "old information". But he called their tech and he was able to get the proper information for the newer version, from their tech support. It took a day or so for the tech to get back to him, but the information was good.

> No vote needed, its already been done. Its called FRS.

Not the same thing. FRS is VERY low power with VERY limited range, and is designed for personal communications over distances of less than 3 miles.

GMRS is available too, but has limited frequency usage (You basically apply to use 2 frequencies, and that's all you can legally use).

What we were bandying about was the original CB band usage, with nearly the same range, on a band more conducive to this type of operation. I picked the 72-76 Mhz band for several reasons.

1. The band is higher in frequency, and will not have nearly the DX opportunities (and associated local interference).

2. The band is "odd", in that there is little commerical or ham equipment that can be adapted to it, which would lessen the amount of illegal power and frequency mods available.

3. The band is still low enough in frequency, that signals are not strictly line of sight, like UHF, and will still provide a decent ground wave direct range.

4. there is less commerical interest in this band than those higher, which are prime candidates for paging, digital phones, and wireless internet services. The FCC could "afford" to allocate 40 or 50 12.5 Khx FM channels for this new "CB band"

5. and hey, 72, is 27 backwards.....

But it's doubtful that this will ever happen.....

There is a bit of a difference between an otherwise intelligent person,
with just a bad attitude (Or wild opinions), and someone with absolutely
no concept of civility. Most of the yahoos on 75, are fighting each
other over a difference of opinion (Religion, politics, whatever). The
idiots that terrorize CB do nothing but swear, dump carriers, play
music, and other annoying traits for the sole intention of disrupting
communications.

Yes, there are idiots everywhere, but it's much easier for a true idiot
to buy a cheap CB, than the go through the trouble and expense of
getting on ham radio.

> To may people buy a cb, turn it on and think that what they
> immediately hear is exactly how CB is, and this isn't true.

If by this you mean that CB is multi-faceted and constantly changing, then yes, this is true. But like you wouldn't eat Filet Mignon that's been soaking in cat piss, it's tough to enjoy the "good" facets of CB, when the all of the "bad" ones pop in and out on a regular basis, especially if you have kids or friends that might be offended at what they hear. If I am embarrassed enough to have to turn off the radio when visitors are present, there is SOMETHING wrong.

I am fully aware of the "pockets" of decent fun still to be had. That's why I'm still here. I'm hoping that when I move 30 miles further out in the next 2 weeks, that I find a new and better group of people to get to know.

I have NEVER seen a radio that has the clarifier unlocked, and the mod done properly, ever be "out of sync" with the TX and RX. The oscillator frequency stays the same, as long as the voltage reference is solid.

>
> Thats why radios built with seperate Tx/Rx, that is a locked Tx and

And you've just gave the biggest reason why radios should not have fixed freq. TX. Since all of the radios cannot possibly be on the same exact frequency, taking all of the temperature, age, and manufacturer variables, then trying to have a roundtable QSO becomes painful, since every one will have to adjust their RIT each time a different person talks.

I'm still waiting for SOMEONE to explain to all of us, just how you can accurately "net" your independant variable TX frequency to that of everyone else on the channel, without having to go 3 or 4 rounds of "how's this", with every station on frequency and then adjusting RX, and how this is supposed to be faster, than just tuning the synchronized TX/RX to one single station ONCE. Sure you might be "close enough for government work", but that's not good enough to eliminate the need to touch up the RIT everytime a different person talks.

I've been running SSB for over 25 years now, and we've had, by far, the least amount of problems when everyone's clarifier is "unlocked".

That antenna was formerly known as the "Super Maxim". It was a 1/2 wave design, slightly less than 18 feet, with 3 short radials.

In the middle 70's, these antennas could be had for $24.95, but had a nasty habit of the SWR climbing in the rain, due to the matching transformer, not being weather sealed very well.

I have been trying to get people on this group to read what Walt Maxwell and others have to say on antenna/transmission line matching, but it seems that no one wants to read-- just argue. Thanks for pointing out Walt's work on-line. His latest work should be published soon, and will be announced on rec radio amateur antenna. It may already be out, and will be worth the effort for all radio operators to find a copy for permanent reference.

It works because the device you're using switches antennas back
and forth. This switching causes the signal to be 'phase modulated'
right at the antenna. The net result is that you have an AM signal
coming in with an FM 'distortion' riding on it. The FM distortion is
what is telling you the direction. When you turn so that the antennas
are receiving the signal equally, then the FM distortion riding on the
signal is zero. You need the FM receiver to receive this FM signal
riding on the AM signal.

It would definately work if the guy was throwing a dead carrier. It
would work to varrying degrees if the guy was talking. You'd just
have to pay attention the the 'tone', not to anything else. If the guy
was transmitting SSB, it might still be usable, but it would be tough
to really distinguish it accurately.

tnom:
I downloaded the article and I'm looking it over. M. Walter Maxwell's
article appears generally quite accurate except where he tries to blame
transmitter overheating to a coupling problem and not reflected power
despite the fact that he wouldn't have a coupling problem if it were
not for the reflected power. He has submitted to the same pitfall that
many do when a lumped element analysis is performed on a circuit consisting
of distributed elements.

HIs idea of proper coupling is a conjugate match. This is fine and
I agree that achieving a conjugate match is extremely desirable.
But just remember that a conjugate match is not equivalent to 50 ohms.
They are only the same when you have no reflections (i.e. 1:1 SWR).
In other words, a 50 ohm transmitter does not provide the power
re-reflection described by Maxwell; you will need some other impedance.

Let's set the coupling issue aside for the moment. Beyond what I've
already said, many of Maxwell's sentences, when taken out of context,
can give an inaccurate interpretation. This is what you are suffering
from.

It would be impractical for Maxwell to include all the necessary qualifiers
in each and every one of his sentences to render them 100% accurate for
100% of the time. You must understand the context of his sentences for
total accuracy.

Let me point out a few of M. Walter Maxwell's
statements from that article.

1) "Rational and creative thinking toward antenna and feed-line design practice has been absent for a long time, having been replaced with an unscientific and thought-inhibiting attitude.

Yes, tnom, he's got you pegged.

2) "...all power reflected from the line/antenna mismatch which reaches the input source is conserved, not dissipated, and is returned to the antenna by the "antenna tuner" (transmatch) at the line input.

Note that re-reflecting the power *required* an antenna tuner. A 50 ohm transmitter without an antenna tuner would have absorbed the reflected power.

3) "All reflected power reaching the source is returned to the load, as part of the forward or incident wave."

This sentence best illustrates my point about misinterpreting statements out of context. Left alone, this sentence is not true. Maxwell used it in the context of describing conditions with a conjugate match.

The statement is true with a conjugate match.
However, if you have reflections on your transmission line, a 50 ohm transmitter does *not* provide a conjugate match without retuning (which would then make it some impedance other than 50 ohms) or an antenna matcher.

Bottom line: For a 50 ohm transmitter, reflected power does flow into the transmitter where it is dissipated as heat. It is an irrefutable fact.

CW for aesthetic reasons? That may be a good word for it. I would have used the word *fun*. Hams like CW for much the same reason that equestrians like horses, even though there are more modern modes of transportation.

The problem is that many people can't separate the issues of the *CW mode* and the *code test*. They attack CW because they don't like the code test.

Try to think of it as the separation of church (the CW religion) and state (the FCC code test)...

warnergt@ptd.net (George Warner) wrote:

> I downloaded the article and I'm looking it over. M. Walter Maxwell's
> article appears generally quite accurate except where he tries to blame
> transmitter overheating to a coupling problem and not reflected power
> despite the fact that he wouldn't have a coupling problem if it were
> not for the reflected power.

Let me follow up on this paragraph. Here are three statements from
Maxwell's article:

M1) "Reflected power does not flow back into the transmitter and cause
dissipation and other damage. Damage blamed on reflections is really
caused by improper output-coupling adjustment -- not the SWR."

M2) "Total rereflection of the reflected power at the line input is the
reason for its not being dissipated at the transmitter."

M3) "...no [reflected power] dissipates in a properly coupled transmitter..."

The first sentence of M1 is not a general truth. It is only true under
a certain specific condition of a conjugate match -- which, by the way, is
the focus of Maxwell's article.
What Maxwell calls "proper coupling" is obviously a conjugate match.

Also, Maxwell states that transmitter damage is dependent on improper
output-coupling adjustment.
He further states that "reflected power... [will] alter the line coupling..."
It is intuitive and obvious that the output-coupling adjustment is dependent
on the SWR. Any change in SWR would require readjustment.
Yet Maxwell states that transmitter damage is caused "not by the SWR."

If A is dependent on B, and B is dependent on C, how can A not
be dependent on C? It is obviously flawed logic that is promoting a
misunderstanding of reflected power.

M2 suggests that if total rereflection did not occur, reflected power
would be dissipated by the transmitter.

M3 suggests that an improperly coupled transmitter *would* dissipate
reflected power.

So, can (not does) reflected power get dissipated in a transmitter?
Maxwell seems to say that it does not while suggesting that it can.

I don't know if Maxwell is assuming that all of his statements are
being interpreted in the context of a conjugate match, or if he is

just using a poor choice of words, of if his interpretation is outright wrong. I think it is the first case.

Ironically, after accusing other authors of "perpetuating the unscientific and erroneous viewpoints" he is unwittingly feeding other errouneous viewpoints.

Don't get me wrong about the article; it is overwhelmingly accurate and very good.
Within the framework of a conjugate match, no reflected power will be dissipated by the transmitter. Is this what he meant when he said merely no reflected power enters the transmitter? Let's hope so. He could have made it clearer.

He talks of the myths of lost reflected power; reflected power is no myth and it can easily be lost but his overall theme is correct in that it doesn't *have* to be lost.

Just gave into a whim and bought a uniden grant xl. It works well on AM but I have yet to raise anybody on ssb. Is it possible that it isn't transmitting on ssb? It receives well on all three modes (am, lsb, usb). I've even heard some dx from arizona and nova scotia (im in nothern virginia).
Try as I might, I can't raise any contact on ssb. Local or otherwise.

SWR is 1.2:1 through my 102" whip and AM is working well.

Any advise? Is there a channel I sould try over the others? There dosen't seem to be too much traffic on ssb except for maybe lower 33.

Thanks.

Well, while SSB is more efficient, it does seem to be more
'competitive' at times. Which can mean it can be tough to
make a contact.

But you got a meter on the radio, right? When you tx in AM,
it should show transmitted power. When you are in SSB, it
should show nothing at all when you don't talk, but bounce
around like an undamped VU meter when you talk. If it does
this, chances are fair to midlin (GOOD!) that the rig is
transmitting. Now the question is transmitting what? But
if it's putting out 'something', and everything else works,
it's probably putting out something correct.

Just keep trying.

Mike

Just be sure to use an antenna matcher to get the SWR to below 2:1,
otherwise it's bye-bye output transistor !!!

Get some coax and peel back 18 feet of shielding from around the
center conductor. Then, stick it up in a tree next to your room.
Drape the other end with the PL259 into your window and connect it to
your CB. Viola, you now have a halfwave dipole.

You're wrong on this one Dave. Dig back
thru your QST magazines. Several years ago
the boys at Fort Collins/Bureau of Standards
proved that ionospheric heating from land
based transmitters is not only possible,
bit practical. If you'll find the article
and read it you will be quite surprised!
They even went so far as to state that a
handful of legal limit amateur stations
would be enough to "create" the phenomenon!

This was the "early" research which helped
spark project HAARP.

Jack

Your turn to read again! In most typical
base antenna installations, there is a sizeable
component of the signal radiated towards the
ground underneath the array. When this rf is
reflected back up underneath the array to the
feedpoint, one of two things can happen, depending
on the height above ground. It will either arrive
back at the feedpoint in phase with the incident
wave being generated by the antenna or it won't.
If the feedpoint is located at a height equal to
a wavelength or any multiple of whole wavelengths
above ground, the incident wave is reinforced by
the return of the reflected ground wave, however if this
is not the case, cancellation between the incident
wave and the reflected wave occurs instead, preventing
optimum operation of the antenna in question.

Flip the radio upside down with the front panel facing you and remove the bottom cover being careful not to pull on the speaker wire, which you should dis-connect at that point. Near the front panel of the radio you will see a small circuit board that is elevated from the main board and is mounted inverted with its circuit traces facing upward. Remove the soldered tab that is connected to the chassis and serves as a ground, making sure that no solder drips or splats onto the main board below, then remove the phillips screw that holds the board in place and remove the board. Look on the component side of the board for a series of three small holes labled Con1, if the radio has solder filling hole one, remove it, and solder holes two and three together. It is very easy to confuse the holes because of the layout so be careful.

The modification is very easy, and what Eagle basicly did was to remove the three pins that pins two and three were shorted out on with a plastic jumper block as you would see on 2950 etc... and leave three empty holes there that you short out holes two and three with solder.

Thats it...the unmarked top center button is your band select, and you will have 10 bands of 40 channels. The LCR button serves as a -5 or +5 kc up or down adjustment. The other buttons function as marked. Do not crank up your AM power & SSB power!! Leave them as stock because this unit has no heat sinks and runs hot!!! Even with a 1.1 SWR it runs hot, so leave it at 4 watts AM, 12 watts or a little under SSB, or you will burn it up!!!! Leave your modulation limiter in place and crank your modulation pot fully clockwise. Run the microphone gain on maximum if using the stock mic, and hold the mic about 8 inches from your mouth and you will get out loud enough and clean enough that people will find it hard to believe that you do not have a power mic. Alot of features for the money!! So Long.

Pardon me if I remain skeptical on this one. I might buy that
THEORETICALLY, you might be able to create an unpredictable, temporary,
unstable and limited range ionospheric "condition", through the focussed
application of very high power, that may result in longer than normal
communications. But I don't believe that it could be applied practically
or reliably for world-wide HF DX. At least not in the way the CBers who
believe it do.

I know that, and so is GMRS, but that is not what I was proposing.

Sometimes, in order to make a point, you have to get graphic......

Sorry about your meal.....

I was at Jo Gunns site and I was wondering what is better the cross or the star? I was thinking about three or 4 elements.
